7. Noise Simulate Test .....	39
8. Thermal Shock Test .....	40

※ Test results are typical data. Nevertheless the following results are considered to be reference data because all units have nearly the same characteristics.

## 1. Calculated Values of MTBF

Parts stress reliability prediction MTBF

**MODEL : CUS600M-12**

### Calculating Method

Calculated based on parts stress reliability prediction of Telcordia (\*1).

Individual failure rate  $\lambda_{ss}$  is calculated by the electric stress and temperature rise of the each part.

\*1: Telcordia document “Reliability Prediction Procedure for Electronic Equipment”  
(Document number SR-332,Issue3)

$$\text{*Formula*} \quad MTBF = \frac{1}{\lambda_{equip}} = \frac{1}{\pi_E \sum_{i=1}^m (N_i \cdot \lambda_{ssi})} \times 10^9 \quad \text{時間 (Hours)}$$

$$\lambda_{ssi} = \lambda_{Gi} \cdot \pi_{Qi} \cdot \pi_{Si} \cdot \pi_{Ti}$$

$\lambda_{equip}$  : Total equipment failure rate (FITs = Failures in  $10^9$  hours)

$\lambda_{Gi}$  : Generic failure rate for the ith part

$\pi_{Qi}$  : Quality factor for the ith part

$\pi_{Si}$  : Stress factor for the ith part

$\pi_{Ti}$  : Temperature factor for the ith part

$m$  : Number of different part types

$N_i$  : Quantity of ith part type

$\pi_E$  : Equipment environmental factor

### MTBF Values

#### Conditions

- Input voltage : 115VAC
- Output voltage & current : 12VDC, 33.4A
- Standby voltage & current : 5VDC, 2A
- Environmental factor : GB (Ground, Benign)
- Mounting method : Standard mounting A
- Cooling : Convection

SR-332,Issue3

MTBF(Ta=25°C) ≈ 424,280 時間 (Hours)

MTBF(Ta=35°C) ≈ 287,004 時間 (Hours)

## 2. Components Derating

**MODEL : CUS600M-12**

### (1) Calculating Method

#### (a) Measuring method

• Mounting method	: Standard mounting A	• Ambient temperature	: 35°C/40°C
• Input voltage	: 115, 230VAC	• Output voltage & current	: 12V, 33.4A
• Cooling	: Convection	• Standby voltage & current	: 5V, 2A

#### (b) Semiconductors

Compared with maximum junction temperature and actual one which is calculated based on case temperature, power dissipation and thermal impedance.

#### (c) IC, Resistors, Capacitors, etc.

Ambient temperature, operating condition, power dissipation and so on are within derating criteria.

#### (d) Calculating method of thermal impedance

$$\theta_{j-c} = \frac{T_{j(max)} - T_c}{P_{ch(max)}} \quad \theta_{j-a} = \frac{T_{j(max)} - T_a}{P_{ch(max)}} \quad \theta_{j-l} = \frac{T_{j(max)} - T_l}{P_{ch(max)}}$$

T<sub>c</sub> : Case Temperature at Start Point of Derating; 25°C in General

T<sub>a</sub> : Ambient Temperature at Start Point of Derating; 25°C in General

T<sub>l</sub> : Lead Temperature at Start Point of Derating; 25°C in General

P<sub>ch(max)</sub> : Maximum Channel Dissipation

T<sub>j(max)</sub> : Maximum Junction (channel) Temperature  
(T<sub>ch(max)</sub>)

θ<sub>j-c</sub> : Thermal Impedance between Junction (channel) and Case  
(θ<sub>ch-c</sub>)

θ<sub>j-a</sub> : Thermal Impedance between Junction and air

θ<sub>j-l</sub> : Thermal Impedance between Junction and Lead

**6. Vibration Test****MODEL : CUS600M-12/19/24/28/32/36/48****(1) Vibration Test Class**

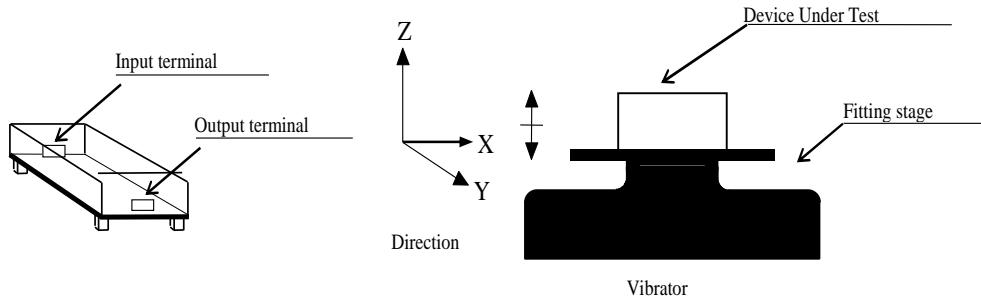

Frequency variable endurance test

**(2) Equipment Used**

IMV CORP. DC-6000-65

**(3) Test Conditions**

- |                   |                                      |               |               |
|-------------------|--------------------------------------|---------------|---------------|
| · Sweep frequency | : 10~55Hz                            | · Direction   | : X, Y, Z     |
| · Sweep time      | : 1.0min                             | · Sweep count | : 1 hour each |
| · Acceleration    | : Constant 19.6m/s <sup>2</sup> (2G) |               |               |

**(4) Test Method****(5) Acceptable Conditions**

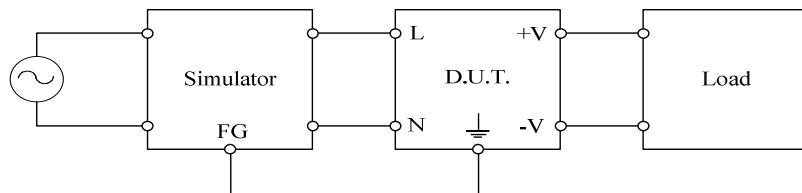

1. Not to be broken
2. No abnormal output after test.

**(6) Test Results****Judgement : OK**

## 7. Noise Simulate Test

**MODEL : CUS600M-12/19/24/28/32/36/48**

### (1) Test Circuit and Equipment

Simulator : INS-400L (Noise Laboratory Co.,LTD)

### (2) Test Conditions

- |                       |                 |                  |                  |
|-----------------------|-----------------|------------------|------------------|
| • Input voltage       | : 115, 230VAC   | • Noise level    | : 0~2kV          |
| • Output voltage      | : Rated         | • Phase          | : 0~360 deg      |
| • Output current      | : 0%, Full load | • Polarity       | : +,-            |
| • Ambient temperature | : 25°C          | • Mode           | : Common, Normal |
| • Pulse width         | : 50~1000ns     | • Trigger select | : Line           |

### (3) Acceptable Conditions

1. The regulation of output voltage must not exceed 5% of initial value during test.
2. The output voltage must be within the regulation of specification after the test.
3. Smoke and fire are not allowed.

### (4) Test Results

**Judgement : OK**

## 8. Thermal Shock Test

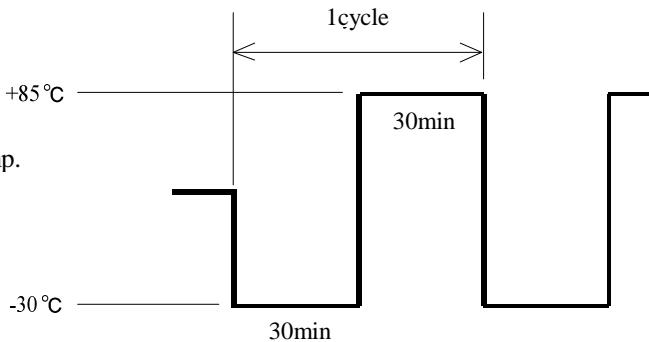

**MODEL : CUS600M-12**

**(1) Equipment Used (Thermal Shock Chamber)**

ESPEC CORP.                   TSA-101S-W

**(2) Test Conditions**

- Ambient Temperature :  $-40^{\circ}\text{C} \Leftrightarrow 85^{\circ}\text{C} +85^{\circ}\text{C}$
- Test Time : 30 min each temp.
- Test Cycle : 700 Cycles
- Not Operating

**(3) Test Method**

Before testing, check if there is no abnormal output, then put the D.U.T. in testing chamber, and test it according to the above cycle. 700 cycles later, leave it for 1 hour at the room temperature , then check if there is no abnormal output.

**(4) Acceptable Conditions**

No abnormal output after test.

**(5) Test Results**

**Judgement :**      **OK**
