Summary of testing:

Tests performed (name of test and test clause):

- 1.5 Components
- 1.6 Power interface
- 1.7 Marking and instructions
- 2.2 SELV circuits
- 2.3 TNV circuits
- 2.9 Electrical insulation
- 2.10 Clearances, creepage distances and distances through insulation
- 4.2 Mechanical strength
- 4.3 Design and construction
- 4.5 Thermal requirements
- 4.7 Resistance to fire
- 5.2 Electric strength
- 5.3 Abnormal operating and fault conditions

Testing Plan:

Our intention is to approve the entire power module platform as listed in Table 1 by testing a minimal number of products. For safety testing, we intend to provide samples of the

HQA2W120W280V and HQA24120W480V. Our expectation is that testing of this highest output voltage, highest input current, widest input voltage range should provide safety approval for the product codes listed in the product matrix Models listed above and Table 1 Examples.

We would like to obtain approval to the following standards: **UL60950** <u>Edition 2</u> (VDE0805), CB scheme (IEC60950), CE mark (EN60950).

We would like to have an approval for our product as a **basic insulation** device with 2250Vdc isolation

Testing location:

TDK-Lambda American Inc.

3320 Matrix Drive, Suite 100, Richardson, Texas 75082, USA

General product information:

The products are component type DC/DC power modules, intended to be used as a component in an end-user's power system. These device are DC-DC power supply with open frame for building-in.

These power supplies internally generate non - SELV voltages and shall be installed in compliance with the enclosure, mounting, spacing (creepage and clearance), casualty, marking and segregation requirements of the end-use application

Schematics are included in the attachment.

The units were tested with a maximum continuous output.

These power supplies have been evaluated for use in a Pollution Degree 2 Environment.

The terminal pins have not been evaluated for field wiring.

The equipment is for building in suitable Electrical and Mechanical Fire Enclosure shall be provided.

All Models are subjected to 100% production line Electric Strength Test at minimum 2121V dc.

The hot-spot temperature shall not be exceeded as specified table page 2.

The power supply series provides Basic insulation based on DC 40 V, between input and output.

- A. If the input meets all requirements for ELV, then the output may be considered ELV
- B. If the input meets all requirements for SELV, then the output may be considered SELV
- C. If the input meets all requirements for TNV-2, then the output may be considered TNV-2 requirements for TNV-2, then the output may be considered TNV-2 or SELV

Product Overview:

The HQA product family consists of high density DC-DC power converter modules intended to be purchased and used as a component in an end-user's power system. The input operating voltage ranges are from 9V – 40Vdc. The output voltage range will be between 3.3V and 48V depending upon the model number.

The HQA product is available in two mechanical configurations that both use the same transformer core set and output filter inductor core set except for the air gap and number of turns embedded in the pcb. The two mechanical configurations use the same pcb and part set, the difference between them is the physical size of the base plate that is mounted on the unit. One house-keeping transformer is used in HQA platform. The house keep magnetic is used to deliver the drive pulses and bias power across the isolation boundary from secondary to the primary side.

HQA Product Family Similarities:

The design intention is that the modules within a platform consist of a family of units with similar form, fit and function with the exception of the output voltage and current. The major differences between the modules will be as follows.

The main PWB, which houses the transformer windings, may need to be changed to modify the number of turns of the power transformer as the output voltage changes. The core material and the structure of the power transformers will remain same. The output inductor core gap and the number of turns for the output inductor may also be changed according to the output current variation, but the core material and structure will stay same.

The power semiconductor devices such as the secondary power FETs, and primary side power FETs, will be in the same physical package but with different voltage rating depending upon the specific input voltage range or output voltage and current stresses in the various power module designs. The output filter capacitors will also be in the same packages but may be different values and voltage ratings depending upon the specific voltage and current stresses in the various module designs.

Control circuits will have value changes to scale the typical circuit parameters such as output voltage and output current limit set point as required for the different designs. Other control circuits such as the

Page 11 of 178

Report No. 214313-CI3-3

feedback compensation may have value changes as required for each specific design. **HQA Family:**

The HQA product line provides a single regulated dc output voltage that is electrically isolated from the input. The HQA series power module is a roughly 2.4" x 2.2" x 0.5" encapsulated (potted) single board design that is available with through-hole I/O pins and includes a base-plate for better heat transfer. Both the power components including the power FETs, power transformers, inductors, and filtering capacitors and the control electronic circuits are located on a multi-layer FR-4 board. The over-temperature sensing device, is mounted on the PWB board. Once the temperature of the board area reaches the preset temperature, the protection circuit will shut the power module in an auto-recovery fashion. The HQA series module offers output over-current protection circuit to protect against both the overload and the short circuit. The input under-voltage is also included in HQA series module design.

Isolation Transformers:

Only two (2) transformers are used in this design. One is the main power transformer that provides primary and secondary isolation and energy transfer, and the other is a bias transformer that provides gate drive information and the on-board house-keeping power for various control circuitry and drivers.

For more detail and test results see previous Test Reports

Abbreviations used in the report:

normal conditions
 functional insulation
 double insulation
 between parts of opposite
 N.C.
 single fault conditions
 basic insulation
 supplementary insulation
