Programmable DC Power Supplies
2.4kW in 1U
Built in RS-232 & RS-485 Interface
Advanced Parallel Operation

Optional Interface:
LXI Compliant LAN
IEEE488.2 SCPI (GPIB) Multi-Drop
Isolated Analog Programming

User Manual

TDK·Lambda
GENESYS™
GEN 2.4kW SERIES POWER SUPPLIES

USER MANUAL

This Manual Covers Models:

GEN8-300    GEN30-80    GEN100-24
GEN10-240    GEN40-60    GEN150-16
GEN16-150    GEN60-40    GEN300-8
GEN20-120    GEN80-30    GEN600-4

Manual Supplement
For units equipped with IEEE488.2 (GPIB) Interface option, refer to Manual IA586-04-01_.

For units equipped with LAN Interface option, refer to Manual IA672-04-01_.

## CHAPTER 6 REMOTE ANALOG PROGRAMMING
- 6.1 INTRODUCTION
- 6.2 LOCAL/REMOTE ANALOG CONTROL
- 6.3 LOCAL/REMOTE ANALOG INDICATION
- 6.4 REMOTE VOLTAGE PROGRAMMING OF OUTPUT VOLTAGE AND CURRENT LIMIT
- 6.5 RESISTIVE PROGRAMMING OF OUTPUT VOLTAGE AND CURRENT LIMIT
- 6.6 REMOTE MONITORING OF OUTPUT VOLTAGE AND CURRENT

## CHAPTER 7 RS232 & RS485 REMOTE CONTROL
- 7.1 INTRODUCTION
- 7.2 CONFIGURATION
  - 7.2.1 Default setting
  - 7.2.2 Address setting
  - 7.2.3 RS232 or RS485 selection
  - 7.2.4 Baud rate setting
  - 7.2.5 Setting the unit into Remote or Local mode
  - 7.2.6 RS232/458 port at Local mode
  - 7.2.7 Front panel in Remote mode
- 7.3 REAR PANEL RS232/485 CONNECTOR
- 7.4 CONNECTING POWER SUPPLIES TO RS232 OR RS485 BUS
  - 7.4.1 Single power supply
  - 7.4.2 Multi power supplies connection to RS232 or RS485 bus
- 7.5 COMMUNICATION INTERFACE PROTOCOL
  - 7.5.1 Data format
  - 7.5.2 Addressing
  - 7.5.3 End of message
  - 7.5.4 Command repeat
  - 7.5.5 Checksum
  - 7.5.6 Acknowledge
  - 7.5.7 Error message
  - 7.5.8 Backspace
- 7.6 ERROR MESSAGES
- 7.7 COMMAND SET DESCRIPTION
  - 7.7.1 General guides
  - 7.7.2 Command set categories
  - 7.7.3 Initialization control commands
  - 7.7.4 ID control commands
  - 7.7.5 Output control commands
  - 7.7.6 Global output commands
  - 7.7.7 Status control commands
- 7.8 STATUS, ERROR AND SRQ REGISTERS
  - 7.8.1 General
  - 7.8.2 Conditional registers
  - 7.8.3 Service Request: Enabled and Event Registers
- 7.9 SERIAL COMMUNICATION TEST SET-UP

## CHAPTER 8 ISOLATED ANALOG PROGRAMMING OPTION
- 8.1 INTRODUCTION
- 8.2 SPECIFICATIONS
  - 8.2.1 0-5V/0-10V option
  - 8.2.2 4-20mA option
- 8.3 ISOLATED PROGRAMMING & MONITORING CONNECTOR
- 8.4 SETUP AND OPERATING INSTRUCTIONS
  - 8.4.1 Setting up the power supply for 0-5/0-10V Isolated Programming and Monitoring
  - 8.4.2 Setting up the power supply for 4-20mA Isolated Programming and Monitoring
- 8.5 PARALLEL OPERATION WITH ISOLATED ANALOG OPTION

## CHAPTER 9 MAINTENANCE
- 9.1 INTRODUCTION
- 9.2 UNITS UNDER WARRANTY
- 9.3 PERIODIC MAINTENANCE
- 9.4 ADJUSTMENT AND CALIBRATION
- 9.5 PARTS REPLACEMENT AND REPAIRS
- 9.6 TROUBLESHOOTING
- 9.7 FUSE RATING
- 9.8 CHAPTER 9 GERMAN TRANSLATION
- 9.9 USER MANUAL INDEX

WARRANTY
This TDK-Lambda Ltd. product is warranted against defects in materials and workmanship for a period of five years from date of shipment. During the warranty period, TDK-Lambda Ltd. will, at its option, either repair or replace products which prove to be defective.

LIMITATION OF WARRANTY
The warranty shall not apply to defects resulting from improper or inadequate usage or maintenance by the buyer, buyer supplied products or interfacing. The warranty shall not apply to defects resulting from unauthorized modifications or from operation exceeding the environmental specifications of the product or if the QA seal has been removed or altered by anyone other than TDK-Lambda Ltd. authorized personnel. TDK-Lambda Ltd. does not warrant the buyer's circuitry or malfunctions of TDK-Lambda Ltd. products resulting from the buyer's circuitry. Furthermore, TDK-Lambda Ltd. does not warrant any damage occurring as a result of the buyer's circuitry or the buyer's supplied products. No other warranty is expressed or implied.

WARRANTY SERVICE
This product must be returned to an authorized TDK-Lambda Ltd. service facility for repairs or other warranty service. For products returned to TDK-Lambda Ltd. for warranty service, the buyer shall prepay shipping charges to TDK-Lambda Ltd. and TDK-Lambda Ltd. shall pay the shipping charges to return the product to the buyer. Refer to section 3.11 for repackaging for shipment.

DISCLAIMER
The information contained in this document is subject to change without notice. TDK-Lambda Ltd. shall not be liable for errors contained in this document or for incidental or consequential damages in connection with the furnishing, performance or use of this material. No part of this document may be photocopied, reproduced or translated into another language without the prior written consent of TDK-Lambda Ltd.

TRADEMARK INFORMATION
Genesys™ power supply is a trademark of TDK-Lambda Ltd. & TDK- Lambda Americas Inc. Microsoft™ and Windows™ are trademarks of Microsoft Corporation.
**FCC Notice**
This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

**NOTE:** This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

**WARNING:** Modifications not expressly approved by the party responsible for compliance could void the user’s authority to operate the equipment under FCC Rules.

**SAFETY/EMC APPROVALS**
UL 60950-1 and CSA22.2 No.60950-1 - UL Listed. C-UL for Canada.
IEC 60950-1 - CB Report and Certificate.
EN 60950-1 - CE mark.
EN 55032
EN 55024

Marking by the CE Symbol indicates compliance to the LVD and EMC Directives of the European Union.

All Models of GEN series except for GENH750W and GEN750W, are professional equipment and are not intended for sale to the general public.

A “Declaration of Conformity” in accordance with the preceding directives and standards has been made and is on file at our EU representative TDK LAMBDA Germany GmbH, Karl-Bold-Str. 40, D-77855 Achern.
A “Declaration of Conformity” may be accessed via company web site
www.emea.tdk-lambda.com/manual

**WARNING:** This is a Class A product. On a domestic environment this product may cause radio interference in which case user may be required to take adequate measures.
SAFETY INSTRUCTIONS

CAUTION
The following safety precaution must be observed during all phases of operation, service and repair of this equipment. Failure to comply with the safety precautions or warnings in this document violates safety standards of design, manufacture and intended use of this equipment and may impair the built-in protections within.

TDK-Lambda Ltd. shall not be liable for user’s failure to comply with these requirements.

INSTALLATION CATEGORY
The Genesys™ power supply series has been evaluated to INSTALLATION CATEGORY II. Installation category (over voltage category) II: local level, appliances, portable equipment etc.. With smaller transient over voltage than Installation Category (over voltage category) III.

GROUNDING
This product is a Safety Class 1 instrument. To minimize shock hazard, the instrument chassis must be connected to an electrical ground. The instrument must be connected to the AC power supply mains through a three conductor power cable for Single Phase models and through a four conductor power cable for Three Phase models with the ground wire firmly connected to an electrical ground (safety ground) at the power outlet.
For instruments designed to be hard-wired to the supply mains, the protective earth terminal must be connected to the safety electrical ground before another connection is made. Any interruption of the protective ground conductor, or disconnection of the protective earth terminal will cause a potential shock hazard that might cause personal injury.

WARNING
OUTPUT TERMINAL GROUNDING
There is a potential shock hazard at the RS232/485 and the IEEE ports when using power supplies with rated or combined voltage greater than 400V and the Positive Output of the Power Supply is grounded. Do Not connect the Positive Output to ground when using the RS232/485 or IEEE.

FUSES
Fuses must be changed by authorized TDK-Lambda Ltd. service personnel only. For continued protection against risk of fire, replace only with the same type and rating of fuse. Refer to maintenance instructions in chapter 9 for fuses rating.

CAUTION MULTI POLE FUSING
The Genesys™ power supply units have fuses in all supply conductors. To prevent potential risk of hazard during servicing, the unit shall be fully disconnected from the supply.

INPUT RATINGS
Do not use AC supply which exceeds the input voltage and frequency rating of this instrument. The input voltage and frequency rating of the Genesys™ power supply series is: 190-240V~, 50/60Hz for Three Phase 200V models and 380-415V~, 50/60Hz for Three Phase 400V models. For safety reasons, the mains supply voltage fluctuations should not exceed +/-10% of nominal voltage.

LIVE CIRCUITS
Operating personnel must not remove the instrument cover. No internal adjustment or component replacement is allowed by non-TDK-Lambda Ltd. qualified personnel. Never replace components with power cable connected. To avoid injuries, always disconnect power, discharge circuits and remove external voltage source before touching components.

PARTS SUBSTITUTIONS & MODIFICATIONS
Parts substitutions and modifications are allowed by authorized TDK-Lambda Ltd. service personnel only. For repairs or modifications, the instrument must be returned to TDK-Lambda Ltd. service facility.
ENVIRONMENTAL CONDITIONS
The Genesys™ power supply series safety approval applies to the following operating conditions:

* Indoor use
* Ambient temperature: 0°C to 50°C
* Maximum relative humidity: 90% (no condensation)
* Altitude: up to 3000m
* Pollution degree (PD): PD2
* IP protection class: IP20

CAUTION: Do not use this product in environments with strong Electromagnetic field, corrosive gas and conductive materials.

CAUTION Risk of Electrical Shock.

Instruction manual symbol. The instrument will be marked with this symbol when it is necessary for the user to refer to the instruction manual.

Indicates hazardous voltage.

Indicates ground terminal.

Protective Ground Conductor Terminal

Off (Supply)

Direct Current (DC)

Alternating Current (AC)

Three-Phase Alternating Current

Standby (Supply)

WARNING: The WARNING sign denotes a hazard. An attention to a procedure is called. Not following procedure correctly could result in personal injury. A WARNING sign should not be skipped and all indicated conditions must be fully understood and met.

CAUTION: The CAUTION sign denotes a hazard. An attention to a procedure is called. Not following procedure correctly could result in damage to the equipment. Do not proceed beyond a CAUTION sign until all indicated conditions are fully understood and met.
SICHERHEITS-INSTALLATIONS ANWEISUNGEN

Vorsicht

Betriebsbedingungen

WARNING Die Genesys™ Stromversorgungen sind zur Installation in geschlossenen Gehäusen vorgesehen. Personenkontakt zu spannungsführenden Teilen (auf der Rückseite der Stromversorgung) muß durch fachgerechte Montage verhindert werden.

Erdungskonzept

⚠️ Vorsicht
Erdung des DC-Ausgangs

Absicherung

ACHTUNG NETZSICHERUNGEN
Das Genesys™ Netzteil hat in allen Versorgungsleitern Sicherungen. Um Gefährdungen während der Wartung des Produktes zu vermeiden muß das Produkt vollständig vom Versorgungsnetz abgesteckt werden.

Anschluss an Versorgungsstromkreis
Der Betrieb des Gerätes ist nur für den dafür spezifizierten Wechselspannungsbereich und der angegebenen Frequenz erlaubt. Der Nominaleingangsspannungsbereich der Genesys™ Serie liegt bei 190-240VAC mit 50/60Hz. Für 3-phasige Geräte mit nom. 200VAC, bzw. 380-415VAC 50/60Hz für 3-phasige Geräte mit nom. 400VAC.
Spannungsführende Teile

Änderungen und Bauteileersatz

SICHERHEITS-HINWEISE

Umweltbedingungen
Die Genesys™ Stromversorgungs-Serie ist gemäß den Sicherheitsabnahmen für folgende Betriebsbedingungen zugelassen.
* Stationäre Einrichtungen in Gebäuden.
* Umgebungstemperaturbereich: 0-50°C.
* Maximale Relative Luftfeuchtigkeit: 90% (nicht kondensierend).
* Betriebshöhe: bis zu 3000m.
* Verschmutzungsgrad 2.

Sicherheits- und Warnsymbole

⚠️ VORSICHT Spannungsführende Teile - Gefahr durch elektrischen Schlag bzw. Energieinhalte.

⚠️ Handbuch-Symbol. Das Gerät bzw. Geräteteile werden mit diesem Symbol gekennzeichnet, wenn es für den Benutzer notwendig ist, sich auf die Anweisungen im Handbuch zu beziehen.

⚡ Zeigt "spannungsführende Teile" mit gefährlicher Spannung an.

接地端子 Anschlussklemme.

glomer Symbol für Schalter oder Druckknöpfe - Zeigt die "Ein"- Stellung hier an.

Symbol für Schalter oder Druckknöpfe - Zeigt die "Aus"-Stellung hier an.

== Gleichspannung (DC)  3~ 3-phasen Wechselspannung

~ Wechselspannung (AC)  ⚡ Symbol für Bereitschaft (Standby)

⚠️ Diese Warnaufschrift weist auf eine Gefahr hin, die eine Überprüfungsanweisung nach sich zieht. Nichteinhaltung kann zu Personenschäden führen. Dieser Warnhinweis darf nicht übersprungen werden und die beschriebene Vorgehensweise muss strikt verstanden werden und dementsprechend umgesetzt werden.

⚠️ Diese "Vorsichtswarnung" weist auf eine Gefahr hin, die einer Vorkehrung bedarf. Nichteinhaltung kann zur Zerstörung der Anlage oder des Gerätes führen. Bitte berücksichtigen Sie alle Anweisungen, die dort beschrieben sind, bevor Sie mit der Benutzung der Anlage bzw. des Gerätes fortfahren.

MASCHINENLAERM
Maschinenlaerminformations-Verordnung – 3. GPSGV, der höchste Schalldruckpegel beträgt 70 dB(A) oder weniger gemass EN ISO 7779.
CHAPTER 1 GENERAL INFORMATION

1.1 USER MANUAL CONTENT
This user’s manual contains the operating instructions, installation instructions and specifications of the Genesys™ 2400W power supply series. The instructions refer to the standard power supplies, including the built-in RS232/485 serial communication. For information related to operation with the optional LAN/IEEE programming, refer to User Manual for Power Supply LAN/IEEE Programming Interface.

1.2 INTRODUCTION

1.2.1 General description
Genesys™ power supplies are wide output range, high performance switching power supplies. The Genesys™ series is power factor corrected and operates from worldwide AC voltage range. Output voltage and current are continuously displayed and LED indicators show the complete operating status of the power supply. The Front panel controls allow the user to set the output parameters, the protection levels (Over-Voltage protection, Under-Voltage limit and Foldback) and preview the settings. The rear panel includes the necessary connectors to control and monitor the power supply operation by remote analog signals or by the built-in serial communication (RS232/485). LAN/IEEE programming and Isolated-Analog programming/monitoring are optional.

1.2.2 Models covered by this manual
Models with rated output from 0-8VDC/0-300A to 0-600VDC/0-4A.

1.2.3 Features and options
* Constant Voltage / Constant Current with automatic crossover.
* Active Power Factor correction.
* Single Phase or Three Phase options.
* Embedded Microprocessor Controller.
* Built in RS232/485 Interface.
* Voltage & Current high resolution adjustment by digital encoders.
* High accuracy programming/readback-16 bit.
* Software Calibration (no internal trimmers / potentiometers).
* Last Setting Memory.
* Independent Remote ON/OFF (opto-isolated) and Remote Enable/Disable.
* Parallel operation (Master/Slave) with Active current sharing.
* Remote sensing to compensate for voltage drop of power leads.
* External Analog Programming and Monitoring standard (0-5V or 0-10V, user selectable).
* Cooling fan speed control for low noise and extended fan life.
* Zero stacking- no ventilation holes at the top and bottom surface of the power supply.
* Optional GPIB interface (SCPI compatible).
* Optional Isolated Analog programming/monitoring (0-5V or 0-10V, user selectable and 4-20mA).

1.2.4 Multiple output power system
The Genesys™ power supplies series can be configured into a programmable power system of up to 31 units using the built-in RS232/RS485 communication port in the power supply and the RS485 linking cable provided with each power supply.
In a GPIB system, each power supply can be controlled using the optional GPIB controller (factory installed).

1.2.5 Control via the serial communication port
The following parameters can be programmed via the serial communication port:
1. Output voltage setting.
2. Output current setting.
3. Output voltage measurement.
4. Output on/off control.
5. Output current measurement.
6. Foldback protection setting.
7. Over-voltage protection setting and readback.
8. Under-Voltage limit setting and readback.
9. Power-supply start up mode (last setting or safe mode)

1.2.6 Analog voltage programming and monitoring
Analog inputs and outputs are provided at the rear panel for analog control of the power supply. The output voltage and the current limit can be programmed by analog voltage or by resistor, and can be monitored by analog voltage. The power supply output can be remotely set to On or Off and analog signals monitor the proper operation of the power supply and the mode of operation (CV/CC).

1.2.7 Parallel operation
Genesys™ power supplies of the same output voltage and current rating can be paralleled in master-slave configuration with automatic current sharing to increase power available.

1.2.8 Output connections
Output connections are made to rear panel bus-bars for models up to 100V and to a 4-terminal wire clamp connector for models above 100V rated output voltage. Either the positive or negative terminal may be grounded or the output may be floated. Models up to 60VDC Rated Output shall not float outputs more than +/- 60VDC above/below chassis ground. Models >60VDC Rated Output shall not float outputs more than +/-600VDC above/below chassis ground. Contact factory for assistance with higher float voltage applications.
Local or remote sense may be used. In remote sense, the voltage drop on the load wires should be minimized. Refer to the specifications for the maximum voltage drop value.
1.2.9 Cooling and mechanical construction
The Genesys™ series is cooled by internal fans. At the installation, care must be taken to allow free air flow into the power supply via the front panel and out of the power supply via the rear panel. The Genesys™ power supplies have a compact and lightweight package which allows easy installation and space saving in the application equipment.

CAUTION

Observe all torque guidelines within this manual. Over torquing may damage unit or accessories. Such damage is not covered under manufacturers warranty.

1.3 ACCESSORIES
1.3.1 General
Accessories are delivered with the power supply or separately upon ordering. The list below shows the possible accessories and ordering numbers.

1.3.2 Serial link cable
Serial link cable, for linking power supplies by RS485 communication is provided with the power supply.
Cable description: 0.5m length, shielded, RJ-45 type plugs, 8 contacts (P/N: GEN/RJ45).

1.3.3 Misc. hardware
* Strain relief for AC cord
* Output terminal shield
* DB25 plug kit (AMP, 749809-9)
* Connector plug kit, (Phoenix Contact, plug:IMC 1,5/7-ST-3,81, Header: IMC 1,5/7-G-3,81)

1.3.4 AC cables
AC cables are not provided with the power supply.
Refer to Table 1-1 for recommended AC input cables (customer supplied). Add a non-locking plug approved by the national safety standards of the country of usage.

2.11 SAFETY/EMC

1.1. Interface classification

- UL 60950-1, CSA22.2 No. 60950-1, IEC 60950-1, EN 60950-1.

1.2. Withstand voltage

- Vout<60V Models: Output and Sense are SELV, RS232/485, IEEE, Isolated Analog, LAN.
- Remote Programming and Monitoring, Auxiliary output 5VDC and Auxiliary output 15VDC are SELV.

- 60V<Vout≤300V Models: Output and Sense are Hazardous, RS232/485, IEEE, Isolated Analog, LAN, Remote Programming and Monitoring (pins 1-3, pins 14-16), Auxiliary output 5VDC are SELV, Remote Programming and Monitoring (pins 8-13, pins 21-25) and Auxiliary output 15VDC are Hazardous.

- 300V<Vout≤600V Models: Output and Sense are Hazardous
  a) Floating output or Output "-" connected to ground: RS232/485, IEEE, Isolated Analog, LAN, Remote Programming and Monitoring (pins 1-3, pins 14-16) and Auxiliary output 5VDC are SELV, Remote Programming and Monitoring (pins 8-13, pins 21-25) and Auxiliary output 15VDC are Hazardous.
  b) Output "+" connected to ground and Vout >400VDC: RS232/485, IEEE, Isolated Analog, LAN, Remote Programming and Monitoring (all pins), Sense, Auxiliary output 15VDC and Auxiliary output 5VDC are Hazardous.

1.3. Insulation resistance

- Input-Output (SELV): 4242VDC/1min., Input-SELV: 4242VDC/1min, Input-Ground: 2828VDC/1min.
- 600V≤Vout≤100V Models:
  - Input-Output: 2600VDC/1min, Input-SELV: 4242VDC/1min, Input-Ground: 2828VDC/1min.
  - Output (Hazardous)-SELV: 1900VDC/1min, Output (Hazardous)-Ground: 1200VDC/1min.
- 150V≤Vout≤600V Models:
  - Input-Output (Hazardous): 4000VDC/1min, Input-SELV: 4242VDC/1min, Input-Ground: 2828VDC/1min, Output (Hazardous)-SELV: 3550VDC/1min, Output (Hazardous)-Ground: 2670VDC/1min.

2.1. Conducted emission

- IEC/EN 55032, IEC/EN 55024, IEC/EN 61000-3-3, FCC part 15-subpart B, VCCI.

2.2. Radiated emission

- EN55032-class A, FCC-class A, VCCI-class A.

NOTES:

*1: Minimum voltage is guaranteed to maximum 0.2% of the rated output voltage.

*2: Minimum current is guaranteed to maximum 0.4% of the rated output current.

*3: For cases where conformance to various safety standards (UL, IEC etc.) is required, to be described as 190~240Vac (50/60Hz).

*4: At 200Vac input voltage, with rated output power.

*5: Not including EMI filter inrush current, less than 0.2mSec.

*6: At 170~265Vac, constant load.

*7: From No-load to Full-load, constant input voltage. Measured at the sensing point in Remote Sense.

*8: For 8V~300V models: measured with JEITA RC-9131A (1:1) probe.

*9: For 600V model: measured with 10:1 probe.

*10: From 10% to 90% or 90% to 10% of rated output voltage, with rated, resistive load.

*11: For load voltage change, equal to the unit voltage rating, constant input voltage.

*12: For 8V~16V models the ripple is measured at 2V rated output voltage and rated output current. For other models, the ripple is measured at 10~100% of rated output voltage and rated output current.

*13: The Constant Current programming readback and monitoring accuracy does not include the warm-up and Load regulation thermal drift.

*14: Measured withJEITA RC-9131A (1:1) probe.

*15: Measured at the sensing point.

*16: Signal and control ports interface cables length: Less than 3m

2.12 SUPPLEMENTAL CHARACTERISTICS

The supplemental characteristics give typical but non-warranted performance characteristics. The supplemental characteristics are useful in assessing applications for the power supply. Several kinds of supplemental characteristics are listed below.

1. Evaluation Data: Typical performance of the power supply.
2. Reliability Data: Reliability performance of the power supply.
3. EN61000 Data: Performance of the power supply under EN61000 test conditions.
4. EMI Data: Typical EMI (conducted and radiated) performance of the power supply.

The supplemental characteristics data is held in each Lambda sales and service facility. For further details please contact the Lambda office nearest you.
2.13 GENESYS™ 2400W POWER SUPPLIES
OUTLINE DRAWINGS

NOTES:
1. Mating plug supplied with power supply.
2. Bus-bars for 8V to 100V models. See detail.
   Wire clamp connector for 150V to 600V models (shown).
3. AC cable strain relief (supplied with power supply).
4. Chassis slides: GENERAL DEVICES P/N: CC3001-00-S160
   or equivalent, mounting holes #10-32 marked "A".
5. Bus Bars enclosure for 60V to 600V.
CHAPTER 3 INSTALLATION

3.1 GENERAL
This chapter contains instructions for initial inspection, preparation for use and repackaging for shipment. Connection to PC, setting the communication port and linking Genesys™ power supplies are described in Chapter 7.

**WARNING**
The Genesys™ series is intended only for installation in Restricted Access Location (RAL). Access to Hazardous parts (rear side of the power supply) shall be prevented after installation.

**WARNING**
Die Genesys™ ist ausschließlich für die Installation in zugangsbeschränkten Bereichen (Restricted Access Location, RAL) gedacht. Der Zugang zu gefährlichen Teilen (Rückseite des Geräts) nach der Installation ist zu unterbinden.

**NOTE**
Genesys™ power supplies generate magnetic fields which might affect the operation of other instruments. If your equipment is susceptible to magnetic field, do not position it adjacent to the power supply.

**WARNING**
To avoid electric shock hazard, do not insert conductive parts through the front panel slits.

**WARNING**
Um die Gefahr eines elektrischen Schlags zu vermeiden, stecken Sie keinerlei elektrisch leitenden Teile durch die Schlitzte der Frontabdeckung.

3.2 PREPARATION FOR USE
In order to be operational the power supply must be connected to an appropriate AC source. The AC source voltage should be within the power supply specification. Do not apply power before reading, Section 3.6 and 3.7.

Table 3-1 below, describes the basic setup procedure. Follow the instructions in Table 3-1 in the sequence given to prepare the power supply for use.

Table 3-1: Basic setup procedure

3.3 INITIAL INSPECTION
Prior to shipment this power supply was inspected and found free of mechanical or electrical defects. Upon unpacking of the power supply, inspect for any damage which may have occurred in transit.

The inspection should confirm that there is no exterior damage to the power supply such as broken knobs or connectors and that the front panel and meters face are not scratched or cracked. Keep all packing material until the inspection has been completed. If damage is detected, file a claim with carrier immediately and notify the Lambda sales or service facility nearest you.

3.4 RACK MOUNTING
The Genesys™ power supply series is designed to fit in a standard 19” equipment rack.

3.4.1 To install the Power Supply in a rack:
1. Use the front panel rack-mount brackets to install the power supply in the rack.
2. Use a support bar to provide adequate support for the rear of the power supply. Do not obstruct the air exhaust at the rear panel of the unit.
3.4.2 Rack Mount Slides (optional):

Ensure that the screws used to attach the slides to the unit do not penetrate more than 6mm into the sides of the unit.

Use rack mount slides: General Devices Catalog Number: C-300-S-116. For Part/Drawing Number: CC3001-00-0160 or equivalent to install the unit in a standard 19" equipment rack. Refer to Fig. 3-1 for slides assembly instructions. Use three #10-32x0.38"(max.) screws at each side. To prevent internal damage, use the specified screw length only.

3.5 LOCATION, MOUNTING AND COOLING

This power supply is fan cooled. The air intake is at the front panel and the exhaust is at the rear panel. Upon installation allow cooling air to reach the front panel ventilation inlets. Allow minimum 10cm (4 inch) of unrestricted air space at the front and the rear of the unit. The power supply should be used in an area that the ambient temperature does not exceed +50°C.

3.6 AC SOURCE REQUIREMENTS

The Genesys™ series designed for use in TN, TT and IT power distribution systems. Depending on its input option, the Genesys™ 2400W series can be operated from a nominal 190V to 240V, single and three phase, 47~63Hz. The input voltage range and current required for each model is specified in Chapter 2. Ensure that under heavy load, the AC voltage supplied to the power supply does not fall below the specifications described in Chapter 2.

3.7 AC INPUT POWER CONNECTION

Connection of this power supply to an AC power source should be made by an electrician or other qualified personnel.

The power supply shall be connected to the AC source via protective device (circuit breaker, fuses, ...etc.) rated 20A max.

There is a potential shock hazard if the power supply chassis (with cover in place) is not connected to an electrical safety ground via the safety ground in the AC input connector.

Es besteht die Gefahr eines elektrischen Schlags, wenn das Gehäuse des Netzteils (milsamt Abdeckung) nicht über den PE-Leiter des Netzkabels mit einer Schutzerde verbunden ist.
3.7.1 AC Input Connector
The AC input connector is a 4-Terminal wire clamp located on the rear panel. Phoenix-Contact P/N: FRONT4-H-7.62/4. Use suitable wires and tightening torque as follows:
1. Wire diameter: 12AWG or 10AWG.
2. Tightening torque: 4.4-5.3Lb-inch. (0.5-0.6Nm).

3.7.2 AC Input Cord
AC input cord is not provided with power supply. Refer to section 1.3.4 for details of the recommended AC input cords and to section 3.7 for disconnected device requirement.

3.7.3 AC Input Wire Connection
1. Strip the outside insulation of the AC cable approx. 10cm. Trim the wires so that the ground wire is 10mm longer than the other wires. Strip 10mm at the end of each of the wires.

2. Unscrew the base of the strain relief from the helix-shaped body. Insert the base through the outside opening in the AC input cover and screw the locknut securely (11-14 Lb-inch.) into the base, from the inside.

3. Slide the helix-shaped body onto the AC cable. Insert the stripped wires through the strain relief base until the outer cable jacket is flush with the edge of the base. Tighten (16-18 Lb-inch.) the body to the base while holding the cable in place. Now the cable is securely fastened inside the strain relief. Refer to Fig.3-2.
4. Route the AC wires to the input connector terminals as required. To connect the wires, loosen the terminal screw, insert the stripped wire into the terminal and tighten the screw securely (4.4-5.3 Lb-inch.).

5. Route the wires inside the cover to prevent pinching. Fasten the cover to the unit using the M3x8 Flat Head screws are provided. Strain relief cover could be opened for inspection. Refer to Fig.3-3 for details.

![Removable cover. Remove only to inspect AC input wires connections. Re-install cover after inspection.](image)

**Fig.3-3: AC input cover and strain relief, 2400W models**

### 3.8 TURN-ON CHECKOUT PROCEDURE

#### 3.8.1 General

The following procedure ensures that the power supply is operational and may be used as a basic incoming inspection check. Refer to Fig.4-1 and Fig.4-2 for the location of the controls indicated in the procedure.

#### 3.8.2 Prior to Operation

1. Ensure that the power supply is configured to the default setting:
   - AC On/Off switch at Off position.
   - Dip switch: All positions at Down ("Off") position.
   - Sense connector: Configured to Local Sense as shown in Fig.3-4:

   ![Sense connector default connection](image)

   **Fig.3-4: Sense connector default connection**

   - For units equipped with IEEE option, ensure that the IEEE_En switch is in Up (default) position (Refer to Fig.4-2, item 8 for location), if checkout is to be done in IEEE mode.
2. Connect the unit to an AC source as described in section 3.7.
3. Connect a DVM with appropriate cables for the rated voltage to the output terminals.
4. Turn the front panel AC power switch to On.

### 3.8.3 Constant Voltage Check
1. Turn on the output by pressing OUT pushbutton so the OUT LED illuminates.
2. Observe the power supply VOLT display and rotate the Voltage encoder. Ensure that the output voltage varies while the VOLT encoder is rotated. The minimum control range is from zero to the maximum rated output for the power supply model. Compare the DVM reading with the front panel VOLT display to verify the accuracy of the VOLT display. Ensure that the front panel VOLT LED is on.
3. Turn off the front panel AC power switch.

### 3.8.4 Constant Current Check
1. Ensure that the front panel AC power switch is at Off position and the DVM connected to the output terminals shows zero voltage.
2. Connect a DC shunt across the output terminals. Ensure that the shunt and the wires' current ratings are higher than the power supply rating. Connect a DVM to the shunt.
3. Turn the front panel AC power switch to On position.
4. Turn on the output by pressing OUT pushbutton so the OUT LED illuminates.
5. Observe the power supply CURRENT display and rotate the CURRENT encoder. Ensure that the output current varies while the CURRENT encoder is rotated. The minimum control range is from zero to the maximum rated output for the power supply model. Compare the DVM reading with the front panel CURRENT display to verify the accuracy of the CURRENT display. Ensure that the front panel CURRENT LED is on.
6. Turn off the front panel AC power switch.
7. Remove the shunt from the power supply output terminals.

### 3.8.5 OVP Check
Refer to Section 5.3 for explanation of the OVP function prior to performing the procedure below.

1. Turn the front panel AC power switch to On position and turn on the output by pressing OUT pushbutton.
2. Using the VOLT encoder, adjust the output voltage to approx. 10% of the unit voltage rating.
3. Momentarily press the OVP/UVL button so that the CURRENT display shows “OUP”. The VOLTAGE display will show the last setting of the OVP level.
4. Rotate the VOLT encoder CCW to adjust the OVP setting to 50% of the unit voltage rating.
5. Wait a few seconds until the VOLT display returns to show the output voltage.
6. Adjust the output voltage toward its maximum and check that the output voltage cannot be increased more than the OVP setting.
7. Adjust OVP limit to the maximum by repeating step 3 and rotating the VOLT encoder CW.

### 3.8.6 UVL Check
Refer to Section 5.4 for explanation of the UVL function prior to performing the procedure below.

1. Press the OVP/UVL button TWICE so that the CURRENT display shows "UUL". The VOLTAGE display will show the last setting of the UVL level.
2. Rotate the VOLT encoder to adjust the UVL level to approx. 10% of the unit voltage rating.
3. Wait a few seconds until the VOLT display returns to show the output voltage.
4. Adjust the output voltage toward its minimum and check that the output voltage cannot be decreased below the UVL setting.
5. Adjust the UVL limit to the minimum by repeating step 1 and rotating the VOLT encoder CW.
3.8.7 Foldback Check

![WARNING]

Shorting the output may expose the user to hazardous voltages. Observe proper safety procedures.

Das Kurzschließen des Ausgangs kann den Anwender einer gefährlichen Spannung aussetzen. Beachten Sie die entsprechenden Sicherheitsrichtlinien.

Refer to Section 5.5 for explanation of the FOLD function prior to performing the procedure below.
1. Ensure that the output voltage is set to approx. 10% of the unit rating.
2. Adjust the CURRENT encoder to set the current limit to approx. 10% of the unit rating.
3. Momentarily press the FOLD button. Ensure that the FOLD LED illuminates. The output voltage remains unchanged.
4. Short the output terminals momentarily (approx. 0.5 sec.). Ensure that the output voltage falls to zero, the VOLT display shows "Fb" and the ALARM LED blinks.
5. Press the FOLD button again to cancel the protection. The output voltage remains zero.
6. Press OUT button. Ensure that the output voltage returns to it’s last setting.
7. Turn the output off by pressing OUT button. Ensure that the VOLT display shows “OFF”.

3.8.8 Address Setting
1. Press and hold the REM/LOC button for approx. 3sec. The VOLT display will show the communication port address.
2. Using the VOLT adjust encoder, check that the address can be set within the range of 0 to 30.

3.8.9 Baud Rate Setting
1. Press and hold the REM/LOC button for approx. 3sec. The CURRENT display will show the communication port Baud Rate.
2. Using The CURRENT adjust encoder, check that the Baud Rate can be set to 1200, 2400, 4800, 9600 and 19200.

3.9 CONNECTING THE LOAD

![WARNING]

Turn off the AC input power before making or changing any rear panel connection. Ensure that all connections are securely tightened before applying power. There is a potential shock hazard when using a power supply with a rated output greater than 50V.

Schalten Sie die Netzversorgung aus, bevor Sie Verbindungen an der Rückseite des Gerätes vornehmen oder ändern. Stellen Sie sicher, dass alle Verbindungen fest und sicher sitzen, bevor Sie das Netz einschalten. Bei Stromversorgungen mit einer Nennausgangsspannung von mehr als 50V besteht grundsätzlich die Gefahr eines elektrischen Schlags.

3.9.1 Load Wiring
The following considerations should be made to select wiring for connecting the load to the power supply:
* Current carrying capacity of the wire (refer to 3.9.2)
* Insulation rating of the wire should be at least equivalent to the maximum output voltage of the power supply.
* Maximum wire length and voltage drop (refer to 3.9.2)
* Noise and impedance effects of the load wiring (refer to 3.9.4).

3.9.2 Current Carrying Capacity
Two factors must be considered when selecting the wire size:
1. Wires should be at least heavy enough not to overheat while carrying the power supply load current at the rated load, or the current that would flow in the event the load wires were shorted, whichever is greater.
2. Wire size should be selected to enable voltage drop per lead to be less than 1.0V at the rated current. Although units will compensate for up to 5V in each load wire, it is recommended to minimize the voltage drop (1V typical maximum) to prevent excessive output power consumption from the power supply and poor dynamic response to load changes. Please refer to Tables 3-2 and 3-3 for maximum wire length to limit voltage drop in American and European dimensions respectively.

</tbody>
</table>

Table 3-3: Maximum wire length for 1V drop on lead (in meters)

For currents not shown in Table 3-2 and 3-3, use the formula:

\[
\text{Maximum length} = \frac{1000}{\text{current \times resistivity}}
\]

where current is expressed in Amperes and resistivity in ohms/km or ohms/1000ft.

3.9.3 Wire termination

The wires should be properly terminated with terminals securely attached. DO NOT use unterminated wires for load connection at the power supply.

**CAUTION**

When local sensing, a short from +LS or +S to -V or -S or -LS, will cause damage to the power supply. Reversing the sense wires might cause damage to the power supply in local and remote sensing. (Do not connect -S to +V or +S to -V.)

**VORSICHT**

3.9.4 Noise and Impedance Effects

To minimize the noise pickup or radiation, the load wires and remote sense wires should be twisted-pairs to the shortest possible length. Shielding of sense leads may be necessary in high noise environments. Where shielding is used, connect the shield to the chassis via a rear panel Ground screw. Even if noise is not a concern, the load and remote sense wires should be twisted-pairs to reduce coupling, which might impact the stability of power supply. The sense leads should be separated from the power leads.

Twisting the load wires reduces the parasitic inductance of the cable which could produce high frequency voltage spikes at the load and the output of power supply, because of current variation in the load itself.

The impedance introduced between the power supply output and the load could make the ripple and noise at the load worse than the noise at the power supply rear panel output. Additional filtering with bypass capacitors at the load terminals may be required to bypass the high frequency load current.

3.9.5 Inductive loads

Inductive loads can produce voltage spikes that may be harmful to the power supply. A diode should be connected across the output. The diode voltage and current rating should be greater than the power supply maximum output voltage and current rating. Connect the cathode to the positive output and the anode to the negative output of the power supply.

Where positive load transients such as back EMF from a motor may occur, connect a surge suppressor across the output to protect the power supply. The breakdown voltage rating of the suppressor must be approximately 10% higher than the maximum output voltage of the power supply.

3.9.6 Making the load connections

**WARNING**

Hazardous voltages may exist at the outputs and the load connections when using a power supply with a rated output greater than 50V. To protect personnel against accidental contact with hazardous voltages, ensure that the load and its connections have no accessible live parts. Ensure that the load wiring insulation rating is greater than or equal to the maximum output voltage of the power supply.

**CAUTION**

Ensure that the load wiring mounting hardware does not short the output terminals. Heavy connecting cables must have some form of strain relief to prevent loosening the connections or bending the bus-bars.

**WARNING**

Bei Stromversorgungen mit einer Nennausgangsspannung von mehr als 50V können an den Ausgängen und den Verbindungen zur Last gefährliche Spannungen anliegen. Um den Anwender vor einem versehentlichen Kontakt mit gefährlichen Spannungen zu schützen, stellen Sie sicher, dass die Last und ihre Verbindungen keine berührbaren spannungsführenden Teile aufweisen. Stellen Sie auch sicher, dass die Isolierung aller Kabel mindestens für die maximal mögliche Ausgangsspannung des Netzteils ausgelegt ist.

**CAUTION**

Stellen Sie sicher, dass über die Anschlussleitungen zur Last kein Kurzschluss der Ausgangsklemmen erfolgen kann. Schwere Anschlusskabel benötigen eine Zugentlastung, um zu verhindern, dass sich Verbindungen lösen oder die Stromschienen verbiegen.

**8V to 100V Models**

Refer to Fig.3-6 for connection of the load wires to the power supply bus-bars and to Fig.3-7 for mounting the bus-bars enclosure to the chassis.
Fig. 3-5: Load wires connection, 8V to 100V models.

Fig. 3-6 Bus-bars cover 8V to 50V

150V to 600V Models

**WARNING**

Hazardous voltages exist at the outputs and the load connections. To protect personnel against accidental contact with hazardous voltages, ensure that the load and its connections have no accessible live parts. Ensure that the load wiring insulation rating is greater than or equal to the maximum output voltage of the power supply.

**CAUTION**

Output Load Wires No Conductor Pretreatment: Phoenix Contact clamping parts are designed so that all kinds of copper conductors can be clamped without pretreatment. It is forbidden to solder the conductors. The solder tin yields and fractures under high pressure. The result is increased contact resistance and an excessive temperature rise. In addition, corrosion caused by pickling or fluxes has been observed on soldered conductor ends. Notch fractures at the transition point from the rigid to the flexible conductor area are also possible.

Fig. 3-7 Bus-bars enclosure 60V~100V

**WARNING**

An den Ausgängen und den Lastverbindungen liegen gefährliche Spannungen an. Um den Anwender vor einem versehentlichen Kontakt mit gefährlichen Spannungen zu schützen, stellen Sie sicher, dass die Last und ihre Verbindungen keine berührbaren spannungsführenden Teile aufweisen. Stellen Sie auch sicher, dass die Isolierung aller Kabel mindestens für die maximal mögliche Ausgangsspannung des Netzteils ausgelegt ist.
The 150V to 600V models have a four terminal wire clamp output connector:
The two left terminals are the positive outputs and the other two right terminals are the negative outputs. Max. 30A per terminal.
The connector requirements are as follows:
2. Tightening torque: 4.4-5.3Lb-inch. (0.5-0.6Nm).

Follow the below instructions for connection of the load wires to the power supply:
1. Strip approx.10mm at the end of each of the load wires.
2. Loosen the connector terminal screws.
3. Loosen screw “B” from enclosure bottom cover to release the shutter.
4. Insert stripped wires into enclosure bottom cover opening and then to the terminals, tighten the terminals screws securely (see fig.3-8)
5. Loosen the two chassis screws marked “A” halfway.
6. Assemble the enclosure top cover to the chassis and tighten screws “A” (tightening torque: 4.8 - 5.3 Lb-inch).
7. Assemble the enclosure bottom cover to it’s place, as shown in Fig.3-9, using screw “C”, (tightening torque 4.8-5.3 Lb-inch).
8. Slide down the shutter to secure load wires in place, and tighten screw “B”.

Fig.3-8: Load wires connection to the output connector

Fig.3-9: Enclosure assembly
3.9.7 Connecting single loads, local sensing (default)
Fig. 3-11 shows recommended load and sensing connections for a single load. The local sense lines shown are default connections at the rear panel J2 sense connector. Local sensing is suitable for applications where load regulation is less critical.

Fig. 3-11: Single load connection, local sensing

3.9.8 Connecting single loads, remote sensing
Fig. 3-12 shows recommended remote sensing connection for single loads. Remote sensing is used when, in Constant Voltage mode, the load regulation is important at the load terminals. Use twisted or shielded wires to minimize noise pick-up. If shielded wires are used, the shield should be connected to the ground at one point, either at the power supply chassis or the load ground. The optimal point for the shield ground should be determined by experimentation.

Fig. 3-12: Remote sensing, single load

3.9.9 Connecting multiple loads, radial distribution method
Fig. 3-13 shows multiple loads connected to one supply. Each load should be connected to the power supply's output terminals using separate pairs of wires. It is recommended that each pair of wires will be as short as possible and twisted or shielded to minimize noise pick-up and radiation. The sense wires should be connected to the power supply output terminals or to the load with the most critical load regulation requirement.
3.9.10 Multiple load connection with distribution terminals

If remotely located output distribution terminals are used, the power supply output terminals should be connected to the distribution terminals by a pair of twisted and/or shielded wires. Each load should be separately connected to the remote distribution terminals (see Fig. 3.14). If remote sensing is required, the sensing wires should be connected to the distribution terminals or at the most critical load.

3.9.11 Grounding outputs

Either the positive or negative output terminals can be grounded. To avoid noise problems caused by common-mode current flowing from the load to ground, it is recommended to ground the output terminal as close as possible to the power supply chassis ground. Always use two wires to connect the load to the power supply regardless of how the system is grounded.

Models up to 60VDC Rated Output shall not float outputs more than +/-60VDC above/below chassis ground. Models > 60VDC Rated Output shall not float outputs more than +/-600VDC above/below chassis ground.

WARNING

Bei Modellen bis 60V DC Nennausgangsspannung darf der Potentialunterschied zwischen Ausgang und Gehäuse-Erdung nicht mehr als +/-60V DC betragen. Bei Modellen mit mehr als 60V DC Nennausgangsspannung darf der Potentialunterschied nicht mehr als +/-600V DC gegenüber der Gehäuse-Erdung aufweisen.
3.10 LOCAL AND REMOTE SENSING

The rear panel J2 sense connector is used to configure the power supply for local or remote sensing of the output voltage. Refer to Fig.3-14 for sense connector location.

3.10.1 Sense wiring

There is a potential shock hazard at the sense connector when using a power supply with a rated output voltage greater than 50V. Local sense and remote sense wires should have a minimum insulation rating equivalent or greater than the maximum output voltage of the power supply. Ensure that the connections at the load end are shielded to prevent accidental contact with hazardous voltages.

3.10.2 Local sensing

The power supply is shipped with the rear panel J2 sense connector wired for local sensing of the output voltage. See Table 3-4 for J2 terminals assignment. With local sensing, the output voltage regulation is made at the output terminals. This method does not compensate for voltage drop on the load wires, therefore it is recommended only for low load current applications or where the load regulation is less critical.

<tr>
<td>J2-5</td>
<td>Remote negative sense (-S).</td>
</tr>
</tbody>
</table>

Table 3-4: J2 terminals

Fig.3-15: Sense connector location
3.10.3 Remote sensing

**WARNING**
There is a potential shock hazard at the sense point when using power supply with a rated output voltage greater than 50V. Ensure that the connections at the load end are shielded to prevent accidental contact with hazardous voltages.

**CAUTION**
When using shielded sense wires, ground the shield in one place only. The location can be the power supply chassis or one of the output terminals.

**WARNUNG**
An den Anschlüssen für die Sense-Leitungen besteht bei Stromversorgungen mit einer Nennausgangsspannung von mehr als 50V die Gefahr eines elektrischen Schlags. Stellen Sie sicher dass die Verbindungen an der Last gegen versehentliches Berühren bei gefährlichen Spannungen isoliert sind.

**VORSICHT**
Wenn Sie abgeschirmte Sense-Leitungen verwenden, erden Sie die Abschirmung nur an einer Seite. Dies kann entweder das Gehäuse des Netzteils oder eine der Ausgangsklemmensein.

Use remote sense where the load regulation at the load end is critical. In remote sense, the power supply will compensate for voltage drop on the load wires. Refer to the power supply specifications for the maximum voltage drop on load wires. The voltage drop is subtracted from the total voltage available at the output. Follow the instructions below to configure the power supply for remote sensing:

1. Ensure that the AC On/Off is in the Off position.
2. Remove the local sense jumpers from J2.
3. Connect the negative sense lead to terminal J2-5 (-S) and the positive sense lead to terminal J2-1 (+S) of the J2 mating connector. Ensure that the J2 mating connector is plugged securely into the rear panel sense connector, J2.
4. Turn On the power supply.

**Notes:**
1. If the power supply is operating in remote sense and either the positive or negative load wire is not connected, an internal protection circuit will activate and shut down the power supply. To resume operation, turn the AC On/Off to the Off position, connect the open load wire, and turn On the power supply.
2. If the power supply is operated without the remote sense lines or local sense jumpers, it will continue to work, but the output voltage regulation will be degraded. Also, the OVP circuit may activate and shut down the power supply.

**Hinweise:**

**3.10.4 J2 sense connector technical information**
- J2 connector type: MC 1.5/5-G-3.81, Phoenix.
- Plug type: MC 1.5/5-ST-3.81, Phoenix.
- Wire AWG; 28 up to 16.
- Stripping length: 7mm.
- Tightening torque: 1.95-2.21 Lb-Inch. (0.22-0.25Nm)

**3.11 REPACKAGING FOR SHIPMENT**

To ensure safe transportation of the instrument, contact the Lambda sales or service facility near you for Return Authorization and shipping information. Please attach a tag to the power supply describing the problem and specifying the owner, model number and serial number of the power supply. Refer to Warranty Information for further instructions.
4.1 INTRODUCTION
The Genesys™ Power Supply series has a full set of controls, indicators and connectors that allow the user to easily setup and operate the unit. Before starting to operate the unit, please read the following sections for explanation of the functions of the controls and connectors terminals.
- Section 4.2: Front panel controls and indicators.
- Section 4.3: Rear panel controls and connectors.

4.2 FRONT PANEL CONTROLS AND INDICATORS
See Fig.4-1 to review the controls, indicators and meters located on the power supply front panel.

**CAUTION**  
The COM terminal (Pin 7) is referenced internally to the -V potential (and J1 Pin 12) of the power supply. Do not attempt to bias any of these terminals relative to the -V or any other potential. Use the Isolated Programming interface option to allow control from a programming source at a different potential.

**VORSICHT**  
4.4 REAR PANEL SW1 SETUP SWITCH

The SW1 Setup switch (see Fig.4-3) is a 9-position DIP switch that allows the user to choose the following:
- Internal or remote programming for Output Voltage and Current Limit.
- Remote voltage or resistive programming of Output Voltage and Output Current limit.
- Select range of remote voltage and resistive programming.
- Select range of Output Voltage and Output Current monitoring.
- Select the Remote Shut-Off control logic.
- Select between RS232 or RS485 communication interface.
- Enable or disable the rear panel Enable/Disable control (dry contact).

4.4.2 Resetting the SW1 switch

Before making any changes to the SW1 switch setting, disable the power supply output by pressing the front panel OUT button. Ensure that the output voltage falls to zero and OUT LED is off, then use any small flat-bladed screwdriver to change the SW1 switch setting.
4.5 REAR PANEL J1 PROGRAMMING AND MONITORING CONNECTOR

The J1 Programming and Monitoring connector is a DB25 subminiature connector located on the power supply rear panel. Refer to Table 4-4 for description of the connector functions. The power supply default configuration is Local operation which does not require connections to J1. For remote operation using J1 signals use the plug provided with power supply or equivalent type. It is essential to use plastic body plug to conform with Safety Agency requirements. If a shield is required for J1 wires, connect the shield to a power supply chassis ground screw.

4.5.1 Making J1 connections
- J1 connector type: AMP, P/N: 5747461-3
- J1 plug description: AMP, P/N: 745211-7
- Wire dimension range: AWG26-22
- Extraction tool: AMP, 91232-1 or equivalent.
- Manual Pistol grip tool:
  - Handle: AMP, P/N: 58074-1
  - Head: AMP, P/N: 58063-2

Before making any connection, turn the AC On/Off switch to the Off position and wait until the front panel display has turned Off.

**CAUTION**

The programming return terminals (12, 22 and 23) are referenced to the -V potential of the power supply. Do not attempt to bias any of these terminals relative to the -V or any other potential. Use the Isolated Programming interface option to allow control from a programming source at a different potential relative to the power supply negative output.

**WARNING**

There is a potential shock hazard at the output when using a power supply with rated output greater than 50V. Use wires with minimum insulation rating equivalent to the maximum output voltage of the power supply.

**CAUTION**

To prevent ground loops and to maintain the isolation of the power supply when programming from J1, use an ungrounded programming source.

**VORSICHT**

**VORSICHT**

Wenn Sie das Netzteil über J1 steuern, verwenden Sie eine potentialfreie Signalquelle, um Erdschleifen zu vermeiden und die Isolation des Netzteils zu erhalten.

**WARNING**

Bei Stromversorgungen mit einer Nennausgangsspannung von mehr als 50V besteht am Ausgang grundsätzlich die Gefahr eines elektrischen Schlags. Verwenden Sie Kabel, deren Isolation mindestens für die maximale Ausgangsspannung des Netzteils ausgelegt ist.

CHAPTER 5  LOCAL OPERATION

5.1 INTRODUCTION
This Chapter describes the operating modes that are not involved in programming and monitoring the power supply via its serial communication port (RS232/RS485) or by remote analog signals. Ensure that the REM/LOC LED on the front panel is Off, indicating Local mode. If the REM/LOC LED is On, press the front panel REM/LOC button to change the operating mode to local.
- For information regarding remote analog programming refer to Chapter 6.
- For information regarding usage of the serial communication port refer to Chapter 7.

5.2 STANDARD OPERATION
The power supply has two basic operating modes: Constant Voltage Mode and Constant Current Mode. The mode in which the power supply operates at any given time depends on the output voltage setting, output current limit setting and the load resistance.

5.2.1 Constant Voltage Mode
1. In constant voltage mode, the power supply regulates the output voltage at the selected value, while the load current varies as required by the load.
2. While the power supply operates in constant voltage mode, the VOLTAGE LED on the front panel illuminates.
3. Adjustment of the output voltage can be made when the power supply output is enabled (Output On) or disabled (Output Off). When the output is enabled, simply rotate the VOLTAGE encoder knob to program the output voltage. When the output is disabled, press the PREV button and then rotate the VOLTAGE encoder knob. The VOLTAGE meter will show the programmed output voltage for 5 seconds after the adjustment has been completed. Then the VOLTAGE meter will display "OFF".
4. Adjustment resolution can be set to coarse or fine resolution.
   Press FINE button to select between the lower and higher resolution. The FINE LED turns On when the resolution is set to FINE.

   **NOTE**
   If after completing the adjustment, the display shows a different value than the setting, the power supply may be at current limit. Check the load condition and the power supply current limit setting.

   **NOTE**
   The maximum and minimum setting values of the output voltage are limited by the Over Voltage protection and Under Voltage limit setting. Refer to Sec.5.3 and 5.4 for more details.

5.2.2 Constant Current Operation
1. In constant current mode, the power supply regulates the output current at the selected value, while the voltage varies with the load requirement.
2. While the power supply is operating in constant current mode, the CURRENT LED on the front panel illuminates.
3. Adjustment of the output current limit can be made when the power supply output is enabled (Output On) or disabled (Output Off).
   - Disabled output (Off): Press PREV button and then rotate the Current encoder knob. The CURRENT meter will show the programmed current limit for 5 seconds after the adjustment has been completed. Then the VOLTAGE meter will display "OFF".
- Enabled output, power supply in Constant Voltage mode: Press the PREV button and then rotate the CURRENT encoder knob. The CURRENT meter will show the programmed current limit for 5 seconds after the adjustment has been completed, and then will return to show the actual load current.
- Enabled output, power supply in Constant Current mode: Rotate the CURRENT encoder knob to adjust the current limit.

4. Adjustment resolution can be set to Coarse or Fine adjustment. Press the FINE button to select between the Coarse and Fine resolution. The FINE LED turns On when the resolution is set to FINE.

5.2.3 Automatic Crossover
If the power supply operates in Constant Voltage mode, while the load current is increased to greater than the current limit setting, the power supply will automatically switch to Constant Current mode. If the load is decreased to less than the current limit setting, the power supply will automatically switch back to Constant Voltage mode.

5.3 OVER VOLTAGE PROTECTION (OVP)
The OVP circuit protects the load in the event of a remote or local programming error or a power supply failure. The protection circuit monitors the voltage at the power supply sense points and thus providing the protection level at the load. Upon detection of an Over Voltage condition, the power supply output will shut down.

5.3.1 Setting the OVP level
The OVP can be set when the power supply output is Enabled (On) or Disabled (Off). To set the OVP level, press the OVP/UVL button, so that the CURRENT meter shows "OUP". The VOLTAGE meter shows the OVP setting level. Rotate the VOLTAGE encoder knob to adjust the OVP level. The display will show "OUP" and the setting value for 5 seconds after the adjustment has been completed and then will return to its previous state.

The OVP can be set when the power supply output is Enabled (On) or Disabled (Off). To set the OVP level, press the OVP/UVL button, so that the CURRENT meter shows "OUP". At this time, the VOLTAGE display will show the OVP setting. After 5 seconds, the display will return to its previous state.

To preview the OVP setting, press OVP/UVL pushbutton so that the CURRENT display will show "OUP". At this time, the VOLTAGE display will show the OVP setting. After 5 seconds, the display will return to its previous state.

5.3.2 Activated OVP protection indications
When the OVP is activated the power supply output shuts down. The VOLTAGE display shows "OUP" and the ALARM LED blinks.

5.3.3 Resetting the OVP circuit
To reset the OVP circuit after it activates:
1. Reduce the power supply Output Voltage setting below the OVP set level.
2. Ensure that the load and the sense wiring is connected properly.
3. There are four methods to reset the OVP circuit.
   3.1 Press OUT button.
   3.2 Turn the power supply Off using the AC On/Off switch, wait until the front panel display turns Off, then turn the power supply On using the AC On/Off switch.
   3.3 Turn the power supply output Off and then On using the SO control (refer to sect.5.7). In this method the power supply should be set to Auto-Restart mode.
   3.4 Send OUT1 command via the RS232/485 communication port.

Table 5-1: Maximum OVP setting levels
5.4 UNDER VOLTAGE LIMIT (UVL)
The UVL prevents adjustment of the output voltage below a certain limit. The combination of UVL and OVP functions allow the user to create a protection window for sensitive load circuitry.

5.4.1 Setting the UVL level
Setting the UVL can be made when the power supply output is Enabled (On) or Disabled (Off). To set the UVL level, press the OVP/UVL button TWICE, so that the CURRENT meter shows "UUL". The VOLTAGE meter shows the UVL setting level. Rotate the VOLTAGE encoder knob to adjust the UVL level. The display will show “UUL” and the setting value for 5 seconds after the adjustment has been completed and then will return to it’s previous state.

UVL setting values are limited at the maximum level to approximately 95% of the Output Voltage setting. Attempting to adjust the UVL above this limit will result in no response to the adjustment attempt. The minimum UVL setting is zero.

5.5 FOLDBACK PROTECTION
Foldback protection will shut down the power supply output if the load current exceeds the current limit setting level. This protection is useful when the load circuitry is sensitive to an over current condition.

5.5.1 Setting the Foldback protection
To arm the Foldback protection, the FOLD button should be pressed so that the FOLD LED illuminates. In this condition, transition from Constant Voltage to Constant Current mode will activate the Foldback protection. Activation of the Foldback protection disables the power supply output, causes the ALARM LED to blink and display "Fb" on the VOLTAGE meter.

5.5.2 Resetting activated Foldback protection
There are four methods to reset an activated Foldback protection.
1. Press the OUT button. The power supply output is enabled and the Output Voltage and current will return to their last setting. In this method, the Foldback protection remains armed, therefore if the load current is higher than the current limit setting, the Foldback protection will be activated again.
2. Press the FOLD button to cancel the Foldback protection. The power supply output will be disabled and the VOLTAGE display will show “OFF”. Press the OUT button to enable the power supply output.
3. Turn the power supply output Off and then On using the SO control (refer to sect. 5.7). In this method the foldback protection remains armed, therefore if the load current is higher than the current limit setting the Foldback protection will be activated.
4. Turn the power supply Off using the AC On/Off switch, wait until the front panel display turns Off, then turn the unit back ON again. The power supply output is enabled and the Output Voltage and Current will return to their last setting. In this method, the Foldback protection remains armed, therefore if the load current is higher than the current limit setting, the Foldback protection will be activated again.

5.6 OUTPUT ON/OFF CONTROL
The Output On/Off enables or disables the power supply output. Use this function to make adjustments to either the power supply or the load without shutting off the AC power. The Output On/Off can be activated from the front panel using the OUT button or from the rear panel J1 connector. The OUT button can be pressed at any time to enable or disable the power supply output. When the output is disabled, the output voltage and current fall to zero and the VOLTAGE display shows “OFF”.

5.7 OUTPUT SHUT-OFF (SO) CONTROL VIA REAR PANEL J1 CONNECTOR
Contacts 2, 3 and 15 of J1 (Fig.4-2, Item 5) serve as Output Shut-Off (SO) terminals. The SO terminals accept a 2.5V to 15V signal or Open-Short contact to disable or enable the power supply output. The SO function will be activated only when a transition from On to Off is detected after applying AC power to unit. (Thus, in Auto-Restart mode, the output will be enabled after applying AC power, even if SO is in Off level.). After On to Off transition is detected, the SO will enable or disable the power supply output according to the signal level or the short/open applied to J1. This function is useful for connecting power supplies in a “Daisy-chain” (refer to section 5.16). The SO control can be used also to reset the OVP and Fold Protection. Refer to sect. 5.3 and 5.5 for details.
When the unit is shut-off by J1 signal, the VOLTAGE display will show “SO” to indicate the unit state. J1 contact 15 is the SO signal input and contacts 2 and 3, IF_COM, are the signal return (connected internally). Contacts 2, 3 and 15 are optically isolated from the power supply output.

The SO control logic can be selected by the rear panel SW1 Setup switch. Refer to Table 5-2 for SW1 setting and SO control logic.

5.8 ENABLE/DISABLE CONTROL VIA REAR PANEL J1 CONNECTOR

Contacts 1 and 14 of J1 (Fig.4-2, Item 5) serve as Output Enable/Disable terminals by switch or relay. This function is enabled or disabled by the SW1 Setup switch position 9. Refer to Table 5-3 for Enable/Disable function and SW1 setting.

</tr>
</tbody>
</table>

Table 5-3: Enable/Disable function and SW1 setting

**CAUTION**
To prevent possible damage to the unit, do not connect any of the Enable/Disable inputs to the positive or negative output potential.

**NOTE**
Safe Start mode - If the Enable/Disable fault condition clears when units in safe start mode recovery is by pressing OUT button or by sending a ‘OUT 1’ serial command.
Auto Restart mode - The output will return back ON automatically when the Enable/Disable fault conditions clears.

**NOTE:** After auto restart setting, you have to set output stage to “ON output” (OUT LED is lightening), to complete and release auto restart mode change.

5.9 CV/CC SIGNAL

CV/CC signal indicates the operating mode of the power supply, Constant Voltage or Constant Current. CV/CC signal is an open collector output with a 30V parallel zener, at J1-13, referenced to the COM potential at J1-12 (connected internally to the negative sense potential). When the power supply operates in Constant Voltage mode, CV/CC output is open. When the power supply operates in Constant Current mode, CV/CC signal output is low (0-0.6), with maximum 10mA sink current.

**CAUTION**
Do not connect CV/CC signal to a voltage source higher than 30VDC. Always connect CV/CC signal to the voltage source with a series resistor to limit the sink current to less than 10mA.

**VORSICHT**
Verbinden Sie den CV/CC-Ausgang nur mit einer Spannungsquelle bis maximal 30V DC. Verbinden Sie den Anschluss stets über einen Vorwiderstand mit der Spannungsquelle, oder begrenzen Sie den Strom auf andere Weise auf max. 10 mA.

5.10 PS OK SIGNAL

PS OK signal indicates fault condition in the power supply. PS OK is a TTL signal output at J1-16, referenced to IF COM at J1-2,3 (Isolated Interface Common). When a fault condition occurs, PS OK level is low, with maximum sink current of 1mA, when no fault condition occurs, PS OK level is high with maximum source current of 2mA. The following faults will set the PS OK to Fault state:

- **OTP** *Enable/Disable open (Power supply is disabled)*
- **OVP** *SO (Rear panel Shut-Off - Power supply is shut off)*
- **Foldback** *IEEE failure (with optional IEEE interface)*
- **AC fail** *Output Off*
5.11 SAFE START AND AUTO-RESTART MODES
When turning on the power supply AC On/Off, it can start to its last setting of Output Voltage and Current limit with the output enabled (Auto-restart) or start with the output disabled (Safe mode). Press and hold the OUT button to select between Safe start and Auto-restart modes. The VOLTAGE display will continuously cycle between "SAF" and "AU7" every 3 seconds. Releasing OUT pushbutton while one of the modes is displayed, selects that mode. The default setting at shipment is Safe mode.

5.11.1 Automatic start mode
In this mode, the power supply restores its last operation setting. Upon start-up, the output is enabled or disabled according to its last setting.

5.11.2 Safe start mode
In this mode, the power supply restores its last operation setting and sets the Output to Off state. At start-up, the output is disabled and the output voltage and current are zero. To enable the output and restore the last output voltage and current limit values, momentarily press OUT button.

5.12 OVER TEMPERATURE PROTECTION (OTP)
The OTP circuit shuts down the power supply before the internal components can exceed their safe internal operating temperature. When an OTP shutdown occurs, the display shows "O7P" and the ALARM LED blinks. Resetting the OTP circuit can be automatic (non-latched) or manual (latched) depending on the Safe or Automatic restart mode.

1. Safe start mode: In Safe start mode, the power supply stays off after the over temperature condition has been removed. The display continue to shows "O7P" and the ALARM LED continues to blink. To reset the OTP circuit, press OUT button (or send OUT ON command via the serial port).
2. Auto-restart mode: In Auto-restart mode, the power supply recovers to its last setting automatically when the over temperature condition is removed.

5.13 LAST SETTING MEMORY
The power supply is equipped with Last Setting Memory, which stores power supply parameters at each AC turn-off sequence.

STORED PARAMETERS:
1. OUT On or Off
2. Output voltage setting (PV setting)
3. Output current limit (PC setting)
4. OVP setting
5. UVL setting
6. FOLD setting
7. Start-up mode (Safe or Auto-restart)
8. Remote/Local: If the last setting was Local Lockout (latched mode), the supply will return to Remote mode (non-latched).
9. Address setting
10. Baud rate
11. Locked / Unlocked front panel (LFP/UFP)
   (Items 8, 9, 10 are related to Remote digital control operation and explained in chapter 7)
12. Master/Slave setting

5.14 SERIES OPERATION
Power supplies of the SAME MODEL can be connected in series to obtain increased output voltage. Split connection of the power supplies gives positive and negative output voltage.
5.14.1 Series connection for increased output voltage

In this mode, two units are connected so that their outputs are summed. Set the current limit of each power supply to the maximum that the load can handle without damage. It is recommended that diodes be connected in parallel with each unit output to prevent reverse voltage during start up sequence or in case one of the units shuts down. Each diode should be rated to at least the power supply rated output voltage and output current. Refer to Fig. 5-1 and 5-2 for series operation with local and remote sensing.

**WARNING**

When power supplies are connected in series, and the load or one of the output terminals is grounded, no point may be at a greater potential of ±50VDC from ground for models up to 60VDC Rated Output and ±600VDC from ground for models >60VDC Rated Output. When using RS232/485 or IEEE, refer to the OUTPUT TERMINALS GROUNDING warning, section 3.9.11.

**WARNING**

Wenn Stromversorgungen in Reihe geschaltet werden und die Last oder eine der Ausgangsklemmen geerdet ist, stellen Sie sicher, dass

- bei Modellen mit bis zu 60V DC Nennspannung kein Punkt ein Potential größer als ±60V gegenüber Erde ausweist,
- bei Modellen mit mehr als 60V DC Nennspannung kein Punkt ein Potential größer als ±600V gegenüber Erde ausweist.

Wenn Sie RS232/485- oder IEEE-Schnittstellen einsetzen, beachten Sie die Warnung "Erdung der Ausgangsklemmen" in Abschnitt 3.9.11.

![Series connection, local sensing](image1)

Fig. 5-1: Series connection, local sensing

![Series connection, remote sensing](image2)

Fig. 5-2: Series connection, remote sensing

**Remote programming in series operation for increased output voltage:**

1. Programming by external voltage:
   The analog programming circuits of this power supply are referenced to the negative output potential. Therefore, the circuits used to control each series connected unit must be separated and floated from each other.

2. Using the SO function and PS_OK signal: The Shut-Off and PS_OK circuits are referenced to the isolated interface common, IF_COM (J1-2,3). The IF_COM terminals of different units can be connected to obtain a single control circuit for the power supplies connected in series.
3. Programming by external resistor:

Programming by external resistor is possible. Refer to section 6.5 for details.

4. Programming via the Serial Communication port (RS232/RS485):

The communication port is referenced to the IF_COM which is isolated from the power supply output potential. Therefore power supplies connected in series can be chained using the Remote-In and Remote-Out connectors. Refer to chapter 7 for details.

**5.14.2 Series connection for positive and negative output voltage**

In this mode, two units are configured as a positive and negative output. Set the current limit of each power supply to the maximum that the load can handle without damage. It is recommended that diodes be connected in parallel with each unit output to prevent reverse voltage during start-up or in case one of the units shuts down. Each diode should be rated to at least the power supply rated output voltage and output current. Refer to Fig.5-3 for this operating mode.

![Diagram of series connection for positive/negative output voltages](image)

*Fig.5-3: Series connection for positive/negative output voltages*

**Remote programming in series operation for positive and negative output voltage**

1. Programming by external voltage:

The analog programming circuits of this power supply are referenced to the negative output potential. Therefore, the circuits used to control each series connected unit must be separated and floated from each other.

2. Using the SO function and PS_OK signal:

The Shut-Off and PS_OK circuits are referenced to the isolated interface common, IF_COM (J1-2,3). The IF_COM terminals of the units can be connected to obtain a single control circuit for the power supplies connected in series.

3. Programming by external resistor:

Programming by external resistor is possible. Refer to section 6.5 for details.

4. Programming via the Serial Communication port (RS232/RS485):

The communication port is referenced to the IF_COM which is isolated from the power supply output potential. Therefore power supplies connected in series can be chained using the Remote-In and Remote-Out connectors. Refer to chapter 7 for details.
5.15 PARALLEL OPERATION

Up to four units of the same VOLTAGE and CURRENT rating can be connected in parallel to provide up to four times the output current capability. One of the units operates as a master and the remaining units are slaves. The slave units are analog programmed by the master unit. In remote digital operation, only the master unit can be programmed by the computer while the slave units may be connected to the computer for voltage, current and status readback only. There are two methods, basic and advanced, to configure multiple supplies for parallel operation. With both methods, Power Supplies, should be connected in a Daisy-Chain configuration. Refer to Sec. 5.15.1, and Sec. 5.15.2 for detailed explanation.

5.15.1 Basic parallel operation

In this method, setting the units as Master and Slaves is made by the rear panel J1 connections and the setup switch SW1. Each unit displays its own output current and voltage. To program the load current, the Master unit should be programmed to the total load current divided by the number of units in the system. Refer to the following procedure to configure multiple supplies for simple parallel operation.

1. Setting up the Master unit
   Set the master unit output voltage to the desired voltage. Program the current limit to the desired load current limit divided by the number of parallel units. During operation, the master unit operates in CV mode, regulating the load voltage at the programmed output voltage. Connect the sensing circuit to local or remote sensing as shown in Fig.5-4 or Fig.5-5.

2. Setting up the slave units
   -1. The output voltage of the slave units should be programmed 2%~5% higher than the output voltage of the master unit to prevent interference with the master unit's control. The current limit of each unit should be programmed to the desired load current limit divided by the number of parallel units.
   -2. Set the rear panel setup switch SW1 position 2 to its up position.
   -3. Set the rear panel setup switch SW1 position 3 in the same position as SW1 position 4 of the master.
   -4. Connect short between J1-8 and J1-12 (refer to Table 4-4.)
   -5. Connect J1 terminal 10(IPGM) of the slave unit to J1 terminal 25(P) of the master unit.
   -6. Connect J1 terminal 23(IPGM_RTN) of the slave unit to J1 terminal 12(COM) of the master unit.

   During operation the slave units operate as a controlled current source following the master output current. It is recommended that the power system is designed so that each unit supplies up to 95% of its current rating because of the imbalance which may be caused by cabling and connections voltage drop.

3. Setting Over Voltage protection
   The master unit OVP should be programmed to the desired OVP level. The OVP of the slave units should be programmed to a higher value than the master OVP. When the master unit shuts down, it programs the slave unit to zero output voltage. If a slave unit shuts down (when its OVP is set lower than the master output voltage), only that unit would shut down and the remaining slave units would supply all the load current.

4. Setting Foldback protection
   Foldback protection if desired, may only be used with the master unit. When the master unit shuts down it programs the slave units to zero output voltage.

5. Connection to the load
   In parallel operation, power supplies can be connected in local or remote sensing. Refer to Fig.5-4 and 5-5 for typical connections of parallel power supplies. The figures show

5.15.2 Advanced parallel operation

In this method, multiple supplies can be configured to parallel operation as a single power supply. The total load current and output voltage are displayed by the Master unit and can be readback from the Master unit. The Slave units display only their operating status (On, Off or Fault condition).

Refer to the following procedure to configure multiple supplies for Advanced parallel operation.

1. Basic configuration
   Repeat steps 1 to 5 in Sec. 5.15.1 (Basic parallel operation).
2. Setting the units as Master or Slave
   a) Depress and hold the FINE button for 3 seconds. The Master/Slave configuration will be displayed on the Current Display. Rotate the CURRENT encoder to obtain the desired mode. Refer to Table 5-4 for the CURRENT display and modes of operation.

<table>
<thead>
<tr>
<th>CURRENT Display</th>

<td>Master supply with 3 Slave supplies</td>
</tr>
<tr>
<td>S</td>
<td>Slave supply</td>
</tr>
</tbody>
</table>

   Table 5-4: Setting mode of operation

   b) When the desired configuration is obtained, depress and release the FINE button or wait approx. 5 seconds.

3. Master and Slave units default operation
   a) When a unit is programmed to Slave mode it enters the Remote mode with Local Lockout. In this mode, the front panel controls are disabled to prevent accidental setting change (refer to Sec. 7.2.7 for details).
   b) The Slave units parameters will automatically set the following:
      * Output voltage to approximate. 102% of rated output voltage. *AST On
      * Programmed Current to zero. *OUT On
      * UVL to zero volts
      * OVP to its maximum value
   c) The Master and Slave modes are stored in the power supply EEPROM when the AC power is turned off. The system will return to the Master/Slave mode upon re-application of AC power.

4. CURRENT display accuracy
   In the advanced parallel mode, the total current is programmed and reported by the Master. In this method, the CURRENT display accuracy is 2%+/- 1 count. In cases that higher accuracy is required, it is recommended to use the basic parallel operation mode.

5. To release units from Slave mode
   Slave units can be released using the following procedure:
   a) Depress FINE button for 3 seconds. The Master/Slave configuration will be displayed on the CURRENT display.
   b) Select H1 mode using the CURRENT encoder.
   c) Depress FINE button again or wait 5 seconds.
   d) Turn the AC power Off to store the new setting.
   e) After exiting from Slave operation the unit’s parameters will be set to:
      * Programmed Voltage to zero *AST OFF
      * Programmed Current to zero *OUT OFF
      * UVL to zero volts *Foldback protection OFF
      * OVP to its maximum value *Locked Front Panel

   CAUTION
   Make sure that the connection between -Vo terminals is reliable to avoid disconnection during operation. Disconnection may cause damage to the power supply.

   VORSICHT
   Stellen Sie sicher, dass die Verbindung zwischen den -V-Anschlussklemmen sich nicht während des Betriebs lösen kann. Eine Unterbrechung kann die Netzteile beschädigen.
With local sensing it is important to minimize the wire length and resistance. Also the positive and negative wire resistance should be close as possible to each other to achieve current balance between power supplies.

5.16 DAISY-CHAIN CONNECTION

It is possible to configure a multiple power supply system to shut down all the units when a fault condition occurs in one of the units. When the fault is removed, the system recovers according to its setting to Safe start mode or Automatic restart. Setup switch SW1 position 5 should be set to its Down position to enable the Daisy-chain operation. Other SW1 positions can be set according to the application requirements. If a fault occurs in one of the units its PS_OK signal will be set to low level and the display will indicate the fault. The other units will shut off and their display will indicate “SO”. When the fault condition is removed, the units will recover to their last setting according to their Safe start or Auto-restart setting. Fig.5-6 shows connection of three units, however the same connection method applies to systems with a larger number of units.

5.17 FRONT PANEL LOCKING

The front panel controls can be locked to protect from accidental power supply parameter change. Press and hold PREV button to toggle between “Locked front panel” and “Unlocked front panel”. The display will cycle between “LFP” and “UFP”. Releasing the PREV button while one of the modes is displayed, selects that mode.

5.17.1 Unlocked front panel

In this mode, the front panel controls are enable to program and monitor the power supply parameters.

5.17.2 Locked front panel

In this mode the following front panel controls are disabled:
- VOLTAGE and CURRENT encoders.
- FOLD button.
- OUT button.

The power supply will not respond to attempts to use these controls. The VOLT display will show “LFP” to indicate that the front panel is locked.

OVP/UVL button is active to preview the OVP and UVL setting.

Use PREV button to preview the output voltage and current setting or to unlock the front panel.
6.1 INTRODUCTION
The rear panel connector J1 allows the user to program the power supply output voltage and current limit with an analog device. J1 also provides monitoring signals for output voltage and output current. The programming range and monitoring signals range can be selected between 0-5V or 0-10V using the setup switch SW1. When the power supply is in Remote Analog programming, the serial communication port is active and can be used to read the power supply parameters.

**CAUTION**
COM (J1-12), VPGM_RTN (J1-22) and IPGM_RTN (J1-23) terminals of J1 are referenced to the -Vout potential (-V). Do not connect these terminals to any potential other than -Vout (-V), as it may damage the power supply.

**VORSICHT**
Am J1-Verbinder sind die Anschlüsse COM (J1-12), VPGM_RTN (J1-22) und IPGM_RTN (J1-23) sind mit dem -Vout-Potential (-V) verbunden. Verbinden Sie diese Anschlüsse nie mit einem anderen Potential als -Vout (-V), da dies das Netzteil beschädigen könnte.

6.2 LOCAL / REMOTE ANALOG CONTROL
Contact 8 of J1 (Fig. 4-2, item 5) accepts TTL signal or Open-Short contact (referenced to J1-12) to select between Local or Remote Analog programming of the output voltage and current limit.
In Local mode, the output voltage and current limit can be programmed via the front panel VOLTAGE and CURRENT encoders or via the RS232/485 port. In Remote Analog mode, the output voltage and current limit can be programmed by analog voltage or by programming resistors via J1 contacts 9 and 10 (refer to sec. 6.4 and 6.5). Refer to Table 6-1 for Local/Remote Analog control (J1-8) function and Setup switch SW1-1, 2 setting.

Table 6-1: Local/Remote Analog control function

6.3 LOCAL / REMOTE ANALOG INDICATION
Contact 21 of J1 (Fig. 4-2, item 5) is an open collector output that indicates if the power supply is in Local mode or in Remote Analog mode. To use this output, connect a pull-up resistor to a voltage source of 30Vdc maximum. Choose the pull-up resistor so that the sink current will be less than 5mA when the output is in low state. Refer to Table 6-2 for J1-21 function.

Table 6-2: Local/Remote Analog indication
Perform the following procedure to set the power supply to Remote Voltage programming:
1. Turn the power supply AC On/Off switch to Off.
2. Set setup switch SW1-1 to its UP position for output voltage external programming and SW1-2 to its UP position for Output Current limit external programming.
3. Set SW1 position 3 to select programming voltage range according to Table 6-3.
4. Ensure that SW1 positions 7 and 8 are at their Down (default) position.
5. Connect a short between J1-8 and J1-12 (refer to Table 4-4).
6. Connect the programming source to the mating plug of J1 as shown in Fig.6-1. Observe correct polarity for the voltage source.
7. Set the programming sources to the desired levels and turn the power supply ON. Adjust the programming sources to change the power supply output.

Notes:
1. SW1 positions 4, 5, 6 and 9 are not required for remote programming. Their setting can be determined according the application.
2. The control circuits allow the user to set the output voltage and current limit up to 5% over the model-rated maximum value. The power supply will operate within the extended range, however it is not recommended to operate the power supply over its voltage and current rating and performance is not guaranteed.

Table 6-3: SW1-3 setting and programming range

Fig.6-1: Remote voltage programming connection
6.5 RESISTIVE PROGRAMMING OF OUTPUT VOLTAGE AND CURRENT LIMIT

For resistive programming, internal current sources, for output voltage and/or output current control, supply 1mA current through external programming resistors connected between J1-9 & 22 and J1-10 & 23. The voltage across the programming resistors is used as a programming voltage for the power supply. Resistance of 0~5Kohm or 0~10Kohm can be selected to program the output voltage and current limit from zero to full scale.

A variable resistor can control the output over its entire range, or a combination of variable resistor and series/parallel resistors can control the output over restricted portion of its range.

Perform the following procedure to set the power supply to Resistive programming:

1. Turn the AC On/Off switch to Off.
2. Set setup switch SW1-1 to its UP position for output voltage external programming and SW1-2 to its UP position for Output Current limit external programming.
3. Set SW1 position 3 to select programming resistor range according to Table 6-4.
4. Set SW1-7 to its UP position for output voltage resistive programming and SW1-8 to its UP position for Output Current limit resistive programming.
5. Connect a short between J1-8, J1-12 and J1-23 (refer to Table 4-4).
6. Connect the programming resistors to the mating plug of J1 as shown in Fig.6-2.
7. Set the programming resistors to the desired resistance and turn the power supply ON. Adjust the resistors to change the power supply output.

NOTES:

1. SW1 positions 4, 5, 6 and 9 are not required for remote programming. Their setting can be determined according to the application requirements.
2. The control circuits allow the user to set the output voltage and current limit up to 5% over the model-rated maximum value. The power supply will operate within the extended range, however it is not recommended to operate the power supply over its voltage and current rating and performance is not guaranteed.
3. To maintain the temperature stability specification of the power supply, the resistors used for programming should be stable and low noise resistors, with temperature coefficient of less than 50ppm.
4. When resistive programming is used, front panel and computer control (via serial communication port) of output voltage and current are disabled.

Table 6-4: SW1-3 setting and programming range

J1 connector, rear panel view

Fig.6-2: Remote resistive programming
6.6 REMOTE MONITORING OF OUTPUT VOLTAGE AND CURRENT

The J1 connector, located on the rear panel provides analog signals for monitoring the output voltage and output current. Selection of the voltage range between 0-5V or 0-10V is made by setup switch SW1-4. The monitoring signals represent 0 to 100% of the power supply output voltage and output current. The monitor outputs have 500 ohm series output resistance. Ensure that the sensing circuit has an input resistance of greater than 500 Kohm or accuracy will be reduced.

Refer to Table 6-5 for required J1 connection, SW1-4 setting and monitoring voltage range.

Table 6-5 Monitoring signals setting

Notes:

1. Radiated emissions, FCC requirements: FCC requirements for radiated emissions, use shielded cable for the analog control signals. In case of using unshielded cable, attach an EMI ferrite suppressor to the cable, as close as possible to the power supply.

2. Front panel encoders operation: In Remote analog mode the output voltage and current can't be set by the VOLTAGE and CURRENT encoders.

3. Front panel PREV button: Use PREV button to display the output voltage and current setting defined by the encoders or communication.

4. Communication: In Remote analog mode, power supply parameters can be programmed and readback via the communication port except output voltage and current setting.
CHAPTER 7  RS232 & RS485 REMOTE CONTROL

7.1 INTRODUCTION
This chapter describes the operation of the Genesys™ 2400W power supplies via the serial communication port. Details of the initial set-up, operation via RS232 or RS485, the command set and the communication protocol are described in this chapter.

7.2 CONFIGURATION

7.2.1 Default setting
The power supply is shipped with the following setting:

- Address: 6
- Baud-rate: 9600
- RS232/485: RS232
- Vout setting: 0
- Iout setting: Maximum
- Master/Slave: H1 (Master)
- Output: Off
- Start up mode: Safe start
- OVP: Maximum
- UVL: 0
- Foldback: Off
- Front panel: Unlocked (UFP)

7.2.2 Address setting
The power supply address can be set to any address between 0 and 30. Follow the instructions described below to set the address.

1. If the unit is in Remote mode (front panel REM/LOC LED illuminates), press REM/LOC button to put the unit into Local mode.
2. Press and hold for approximately 3 sec. the REM/LOC button. The VOLTAGE display will indicate the communication port address.
3. Using the VOLTAGE adjust encoder, select the address.

To preview the address at any time, press and hold the REM/LOC button for approx. 3 sec. The VOLTAGE display will indicate the power supply address.

7.2.3 RS232 or RS485 selection
To select between RS232 or RS485 set the rear panel setup switch SW1-6 position to:
- Down for RS232
- Up for RS485

7.2.4 Baud rate setting
Five optional rates are possible: 1200, 2400, 4800, 9600 and 19200. To select the desired rate, the following steps should be taken:

1. If the unit is in Remote mode (front panel REM/LOC LED illuminates), press REM/LOC button to put the unit into Local mode.
2. Press and hold for approx. 3 sec. the REM/LOC button. The CURRENT display will show the communication port Baud Rate.
3. Using the CURRENT adjust encoder, select the desired Baud Rate.

7.2.5 Setting the unit into Remote or Local mode
1. The unit will be put into Remote mode only via serial communication command.
   Commands that will put the unit into Remote mode are:

   RST PV n
   OUT n PC n
   RMT n
   (for n values see Tables 7-3, 7-4, 7-5 and 7-6)
2. There are two Remote modes:

1. Remote: In this mode, return to local can be made by the front panel REM/LOC or via serial port command RMT 0. Set the unit into Remote mode via serial port RMT 1 command.

2. Local Lockout: In this mode the unit can be returned to Remote mode via the serial port RMT 1 command or by turning off the AC power until the display turns off and then turn it on again. In Local Lockout mode, the front panel REM/LOC button is not active. Set the unit into Local Lockout mode via serial port RMT 2 command.

7.2.6 RS232/485 port in Local mode
When the power supply is in local mode, it can receive queries or commands. If a query is received, the power supply will reply and remain in Local mode. If a command that affects the output is received, the power supply will perform the command and change to Remote mode. Serial commands may be sent to set the status registers and read them while the unit is in Local mode. If the Enable registers are set (refer to section 7.8) the power supply will transmit SRQ’s while in Local.

7.2.7 Front panel in Remote mode
Front panel control in Remote mode is disabled except for:
1. PREV: use to preview the Voltage and Current limit setting.
2. OVP/UVL: use to preview the OVP/UVL setting.
3. LOC/REM: use to set the unit into Local mode.
In Local Lockout mode, only PREV and OVP/UVL are active.

7.3 REAR PANEL RS232/485 CONNECTOR
The RS232/485 interface is accessible through the rear panel RS232/485 IN and RS485 OUT connectors. The connectors are 8 contact RJ-45. The IN and OUT connectors are used to connect power supplies in a RS232 or RS485 chain to a controller. Refer to Fig.7-1 for IN/OUT connectors

![Fig.7-1: J3 rear panel IN/OUT connectors pinout](image)

**NOTE**

Tx and Rx are used for RS232 communication. Txd +/- and Rxd +/- are used for RS485 communication. Refer to RS232 and RS485 cables description for connection details.
7.4 CONNECTING POWER SUPPLIES TO RS232 OR RS485 BUS

7.4.1 Single power supply
1. Select the desired interface RS232 or RS485 using rear panel setup switch SW1-6 (section 4-4).
   - RS232: Down position
   - RS485: Up position
2. Connect rear panel IN connector to the controller RS232 or RS485 port using a suitable shielded cable. Refer to Figures 7-2, 7-3 and 7-4 for available RS232 and RS485 cables.
7.4.2 Multi power supply connection to RS232 or RS485 bus
Daisy-chain up to 31 units can be connected to RS232 or RS485 bus. The first unit connects to the controller via RS232 or RS485 and the other units are connected with RS485 bus, the user must set all slave supplies to a unique address. No two supplies may have the same address.
1. First unit connection: Refer to section 7.4.1 for connecting the first unit to the controller.
2. Other units connection: The other units on the bus are connected via their RS485 interface.
   Refer to fig.7-5 for typical connection.
   - Set rear panel setup switch SW1-6 to it's UP position
   - Using the Linking cable supplied with each unit (refer to Fig.7-6), connect each unit OUT connector to the next unit IN connector.
* It is recommended when using ten or more power supplies in Daisy-chain system to connect a 120 ohm resistive termination at the last unit's RS485 OUT connector.
120Ω, 0.5W between TXD' and TXD'
120Ω, 0.5W between RXD' and RXD'

7.5 COMMUNICATION INTERFACE PROTOCOL

7.5.1 Data format
Serial data format is 8 bit, one start bit and one stop bit. No parity bit.

7.5.2 Addressing
The Address is sent separately from the command.
It is recommended to add a 100 msec software delay between query or sent command to next unit addressing.
Refer to section 7.7.3 for details.

7.5.3 End of Message
The end of message is the Carriage Return character (ASCII 13). The power supply ignores the Line Feed (ASCII 10) character.

7.5.4 Command Repeat
The backslash character "\" will cause the last command to be repeated.

7.5.5 Checksum
The user may optionally add a checksum to the end of the command. The checksum is "$" followed by two hex characters. If a command or a query has checksum, the response will also have one. There is no CR between the command string and the "$" sign.
Example: STT?$3A
STAT?$7B

7.5.6 Acknowledge
The power supply acknowledges received commands by returning "OK" message. If an error is detected, the power supply will return an error message. The rules of checksum apply also to the acknowledge.
7.5.7 Error message
If an error is detected in a command or query, the power supply will respond with an error message. Refer to section 7.6 for details.

7.5.8 Backspace
The backspace character (ASCII 8) clears the last character sent to the power supply.

7.6 ERROR MESSAGES
The power supply will return error messages for illegal commands and illegal programming parameters. Refer to Table 7-1 for programming error messages and Table 7-2 for commands error messages.

Table 7-1: Programming error messages

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>

7.7 COMMAND SET DESCRIPTION

7.7.1 General guides
1. Any command or argument may be in capital letters or small letters.
2. In commands with an argument, a space must be between the command and the argument.
3. For any command that sets a numeric value, the value may be up to 12 characters long.
4. Carriage Return: If the CR character (ASCII 13) is received by itself, the power supply will respond with “OK” and CR.

7.7.2 Command set categories
The Genesys 2400W series command set is divided into four categories as follows:
1. Initialization control
2. ID control
3. Output control
4. Status control
### 7.7.3 Initialization control commands

<table>
<thead>
<tr>
<th>#</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ADR n</td>
<td>ADR is followed by address which can be 0 to 30 and is used to access the power supply.</td>
</tr>
<tr>
<td>2</td>
<td>CLS</td>
<td>Clear status. Sets FEVE and SEVE registers to zero (refer to section 7-8).</td>
</tr>
<tr>
<td>3</td>
<td>RST</td>
<td>Reset command. Brings the power supply to a safe and known state: Output voltage: zero, Remote: non-latched remote, Output current: zero, Auto-start: Off, Output: Off, OVP: maximum, FOLD: Off, UVL: zero The conditional registers (FLT and STAT) are updated, the other registers are not changed.</td>
</tr>
<tr>
<td>4</td>
<td>RMT</td>
<td>Sets the power supply to local or remote mode: 1. RMT 0 or RMT LOC, sets the power supply into Local mode. 2. RMT 1 or RMT REM, sets the unit into remote mode. 3. RMT 2 or RMT LLO, sets the unit into Local Lockout mode (latched remote mode).</td>
</tr>
<tr>
<td>5</td>
<td>RMT?</td>
<td>Returns the Remote mode setting: 1. &quot;LOC&quot;- The unit is in Local mode. 2. &quot;REM&quot;- The unit is in Remote mode. 3. &quot;LLO&quot;- The unit is in Local Lockout (latched remote) mode.</td>
</tr>
<tr>
<td>6</td>
<td>MDAV?</td>
<td>Returns MD MODE OPTION Status. 1 indicates installed and 0 indicates not installed.</td>
</tr>
<tr>
<td>7</td>
<td>\ \</td>
<td>Repeat last command. If &lt;CR&gt; is received, the power supply will repeat the last command.</td>
</tr>
</tbody>
</table>

### 7.7.4 ID control commands

<table>
<thead>
<tr>
<th>#</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>IDN?</td>
<td>Returns the power supply model identification as an ASCII string: LAMBDA, GENX-Y</td>
</tr>
<tr>
<td>2</td>
<td>REV?</td>
<td>Returns the software version as an ASCII string.</td>
</tr>
<tr>
<td>3</td>
<td>SN?</td>
<td>Returns the unit serial number. Up to 12 characters.</td>
</tr>
<tr>
<td>4</td>
<td>DATE?</td>
<td>Returns date of last test. Date format: yyyy/mm/dd</td>
</tr>
</tbody>
</table>

### 7.7.5 Output control commands

<table>
<thead>
<tr>
<th>#</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>PV n</td>
<td>Sets the output voltage value in Volts. The range of voltage value is described in Table 7-3. The maximum number of characters is 12. See the following examples for PV n format: PV 12, PV 012, PV 12.0, PV 012.00, etc...</td>
</tr>
<tr>
<td>2</td>
<td>PV?</td>
<td>Reads the output voltage setting. Returns the string &quot;n&quot; where &quot;n&quot; is the exact string sent in the PV n command. When in Local mode, returns the PREVIEW (front panel) settings in a 5 digits string.</td>
</tr>
<tr>
<td>3</td>
<td>MV?</td>
<td>Reads the actual output voltage. Return 5 digits string. Example: 60V supply sends 01.150, 15.012, 50.000, etc...</td>
</tr>
<tr>
<td>4</td>
<td>PC n</td>
<td>Sets the output current value in Amperes. The range of current values is described in Table 7-4. The maximum number of characters is 12. See the following examples for PC n format: PC 10, PC 10.0, PC 010.00, etc... (See Note 1)</td>
</tr>
<tr>
<td>5</td>
<td>PC?</td>
<td>Reads the output current setting. Returns the string &quot;n&quot; where &quot;n&quot; is the exact string sent in the PC n command. When in Local mode, returns the PREVIEW (front panel) settings in a 5 digits string.</td>
</tr>
</tbody>
</table>
### 7.7.5 Output control commands-cont

<table>
<thead>
<tr>
<th>#</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>MC?</td>
<td>Reads the actual output current. Returns 5 digits string. Example: 200A supply sends 000.50, 110.12, 200.00, etc...</td>
</tr>
<tr>
<td>7</td>
<td>DVC?</td>
<td>Display Voltage and Current data. Data will be returned as a string of ASCII characters. A comma will separate the different fields. The fields, in order, are: Measured Voltage, Programmed Voltage, Measured Current, Programmed Current, Over Voltage Set point and Under Voltage Set point. Example: 5.9999, 6.0000, 010.02, 010.00, 7.500, 0.000</td>
</tr>
<tr>
<td>8</td>
<td>OUT n</td>
<td>Turns the output to ON or OFF. Recover from Safe-Start, OVP or FLD fault. OUT 1 (or OUT ON)-Turn On.</td>
</tr>
<tr>
<td>9</td>
<td>OUT?</td>
<td>Returns the output On/Off status string. ON- output on. OFF- output off.</td>
</tr>
<tr>
<td>10</td>
<td>FLD n</td>
<td>Sets the Foldback protection to ON or OFF. FLD 1 (or FOLD ON) - Arms the Foldback protection. FLD 0 (or FOLD OFF) - Cancels the Foldback protection. When the Foldback protection has been activated, OUT 1 command will release the protection and re-arm it, while FLD 0 will cancel the protection.</td>
</tr>
<tr>
<td>11</td>
<td>FLD?</td>
<td>Returns the Foldback protection status string: &quot;ON&quot;- Foldback is armed, &quot;OFF&quot;- Foldback is canceled.</td>
</tr>
<tr>
<td>12</td>
<td>FBD nn</td>
<td>Add (nn x 0.1) seconds to the Fold Back Delay. This delay is in addition to the standard delay. The range of nn is 0 to 255. The value is stored in eprom at AC power down and recovered at AC power up.</td>
</tr>
<tr>
<td>13</td>
<td>FBD?</td>
<td>Supply returns the value of the added Fold Back Delay.</td>
</tr>
<tr>
<td>14</td>
<td>FBDRST</td>
<td>Reset the added Fold Back Delay to zero.</td>
</tr>
<tr>
<td>15</td>
<td>OVP n</td>
<td>Sets the OVP level. The OVP setting range is given in Table 7-5. The number of characters after OVP is up to 12. The minimum setting level is approx. 105% of the set output voltage, or the value in Table 7-6, whichever is higher. The maximum setting level is shown in Table 5-1. Attempting to program the OVP below this level will result in execution error response (&quot;E04&quot;). The OVP setting stays unchanged.</td>
</tr>
<tr>
<td>16</td>
<td>OVP?</td>
<td>Returns the setting “n” where “n” is the exact string in the user’s “OVP n”. When in Local mode, returns the last setting from the front panel in a 4 digit string.</td>
</tr>
<tr>
<td>17</td>
<td>OVM</td>
<td>Sets OVP level to the maximum level. Refer to Table 7-5.</td>
</tr>
<tr>
<td>18</td>
<td>UVL n</td>
<td>Sets Under Voltage Limit. Value of “n” may be equal to PV setting, but returns “E06” if higher. Refer to Table 7-6 for UVL programming range.</td>
</tr>
<tr>
<td>19</td>
<td>UVL?</td>
<td>Returns the setting “n” where “n” is the exact string in the user’s “UVL n”. When in Local mode, returns the last setting from the front panel in a 4 digit string.</td>
</tr>
<tr>
<td>20</td>
<td>AST n</td>
<td>Sets the auto-restart mode to ON or OFF. AST 1 (or AST ON) - Auto restart on. AST 0 (or AST OFF) - Auto restart off.</td>
</tr>
<tr>
<td>21</td>
<td>AST?</td>
<td>Returns the string auto-restart mode status.</td>
</tr>
<tr>
<td>22</td>
<td>SAV</td>
<td>Saves present settings. The settings are the same as power-down last settings. These settings are erased when the supply power is switched off and the new “last settings” are saved.</td>
</tr>
<tr>
<td>23</td>
<td>RCL</td>
<td>Recalls last settings. Settings are from the last power-down or from the last “SAV” command.</td>
</tr>
<tr>
<td>24</td>
<td>MODE?</td>
<td>Returns the power supply operation mode. When the power supply is On (OUT 1) it will return “CV” or “CC”. When the power supply is OFF (OUT 0) it will return “OFF”.</td>
</tr>
<tr>
<td>25</td>
<td>MS?</td>
<td>Returns the Master/Slave setting. Master: n = 1, 2, 3, or 4 Slave: n = 0</td>
</tr>
</tbody>
</table>
NOTES:
1. In Advanced parallel mode (refer to Sec. 5.15.2), “n” is the total system current.
2. In Advanced parallel mode, “MC?” returns the Master unit current multiplied by the number of slave units+1.

7.7.6 Global output commands

1. General
All supplies, even if not the currently addressed supply, receiving a global command will execute the command. No response to the PC issuing the command will be returned to the PC. The PC issuing the command will be responsible to delay and any other communications until the command is execute. 200 Ms minimum is the suggested delay.
If the command contains an error, out of range values for example, no error report will be sent to the issuing PC.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
</table>
| 1. | GRST | Reset. Brings the Power Supply to a safe and known state: Output voltage: 0V, output current: 0A, OUT: Off, Remote: RMT 1’
AST: Off OVP: Max, UVL: 0. The conditional register (FLT and STAT) are updated. Other registers are not changed.
Non-Latching faults (FB, OVP, SO) are cleared, OUT fault stays. |
| 2. | GPV n | Sets the output voltage value in volts. The range of voltage values is shown in Table 7-3. ‘n’ may be up to 12 char plus dec. pt |
| 3. | GPC n | Program the output current value in amperes. The range of current values is shown in Table 7-4. ‘n’ may be up to 12 char plus dec. pt |
| 4. | GOUT | Turns the output to ON or OFF:
“GOUT 1/ON” = turn on
“GOUT 0/OFF”= turn off, clears CV and CC bits in the Status Condition (STAT)
OUT ON will respond with “E07” if the output cannot be turned on because of a latching fault (OTP< AC, ENA, SO) shutdown. |
| 5. | GSAV | Save present settings. Same settings as power-down last settings listed in Error! Reference source not found. Except the address and Baud rate are not saved Saves to the RAM. These settings are erased when the supply power is switched off and the new ‘last settings’ are saved. |
| 6. | GRCL | Recall last settings. Settings are from last power-down or from last ‘SAV’ or ‘GSAV’ command. Address and Baud rate are not recalled so communication is not interrupted. |

7.8 STATUS, ERROR AND SRQ REGISTERS

7.8.1 General
This section describes the various status error and SRQ registers structure. The registers can be read or set via the RS232/485 commands. When using the IEEE option, refer to the user manual for Genesys™ Power Supply IEEE Programming interface. Refer to Fig. 7-7 for the Status and Error Registers Diagram.

Fig. 7-7: Status and Error Registers Diagram

7.8.2 Conditional registers
The fault Condition Register and the Status Condition Register are read only registers that the user may read to see the condition of the supply. Refer to table 7-8 for description of the Fault Condition Register bits and Table 7-9 for the Status Condition register bits.

7.8.3 Service Request: Enable and Event Registers

The conditional Registers are continuously monitored. When a change is detected in a register bit which is enabled, the power supply will generate an SRQ message. The SRQ message is: "Inn" terminated by CR, where the nn is the power supply address. The SRQ will be generated either in Local or Remote mode.
Refer to Tables 7-9 to 7-12 for details of the Enable and Event registers.

1. **Fault Enable Register**
The Fault Enable Register is set to the enable faults SRQs.

Table 7-9: Fault Enable Register

<table>
<thead>
<tr>
<th>BIT</th>
<th>Enable bit name</th>
<th>Fault symbol</th>
<th>Bit Set condition</th>
<th>Bit reset condition</th>
</tr>
</thead>
<tbody>
<tr>

<td>&quot;SENA nn&quot; command</td>
<td>&quot;SENA nn&quot; command</td>
</tr>
</tbody>
</table>

4. Status Event Register
The Status Event Register will set a bit if a change in the power supply status occurs and it is enabled. The register is cleared when the "SEVE?" or "CLS" commands are received. A change in this register will generate SRQ.

Table 7-12: Status Event Register

<table>
<thead>
<tr>
<th>BIT</th>
<th>Status name</th>
<th>Status symbol</th>
<th>Bit Set condition</th>
<th>Bit reset condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 (LSB)</td>
<td>Constant Voltage</td>
<td>CV</td>
<td>Changes in status occurs and it is enabled.</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>Constant Current</td>
<td>CC</td>
<td>The change can set a bit, but when the change clears the bit remains set.</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>No Fault</td>
<td>NFLT</td>

<td>0</td>
<td>Always zero</td>
<td></td>
</tr>
<tr>
<td>7 (MSB)</td>
<td>Local Mode</td>
<td>LCL</td>
<td>Unit is set to Local by pressing front panel REM/LOC button.</td>
<td></td>
</tr>
</tbody>
</table>

Entire Event Register is cleared when user sends "SEVE?" command to read the register. "CLS" and power-up also clear the Status Event Register. (The Fault Event Register is not cleared by RST)
7.9 SERIAL COMMUNICATION TEST SET-UP

Use the following instructions as basic set-up to test the serial communication operation.

1. **Equipment:** PC with Windows Hyper Terminal, private edition, software installed, Genesys™ power supply, RS232 cable.

2. **PC set-up:**
   2.1 Open Hyper Terminal....................... New Connection.
   2.2 Enter a name
   2.3 Connect to................................... Direct to Com1 or Com2
   2.4 Configure port properties:

   - Bits per second ......9600
   - Data bits .................8
   - Parity ......................None
   - Stop bits..................1
   - Flow control..............None

   2.5 Open Properties in the program File.........................Properties

   2.6 Setting: ASCII Set Up
   Select Echo characters locally, select send line ends with line feed.
   On some PC systems, pressing the number keypad "Enter" will distort displayed messages. Use the alphabetic "Enter" instead.

3. **Power supply set-up:**
   3.1 Connect the power supply to the PC using the RS232 cable.
   3.2 Set via the front panel: Baud Rate: 9600, Address: 06.
   3.3 Set via the rear panel: RS232/485 to RS232 (refer to section: 4-4).

4. **Communication Test:**
   4.1 Model identification:
   - PC: write: ADR 06
   - Power supply response: "OK"

   4.2 Command test:
   - PC write: OUT 1
   - Power supply response: "OK"
   - PC write: PV n
   - Power supply response: "OK"
   - PC write: PC n (for n values see Tables 7-3, 7-4 and 7-5)
   - Power supply response: "OK"

   The power supply should turn on and the display will indicate the output voltage and the actual output current.
CHAPTER 8 ISOLATED ANALOG PROGRAMMING OPTION

8.1 INTRODUCTION

Isolated Analog Programming is an internal option card for analog programming of the Genesys™ power supply series. The option is factory installed and cannot be obtained with GPIB (IEEE) Interface. Output Voltage and Current Limit can be programmed and readback through optically isolated signals which are isolated from all other ground references in the power supply.

There are two types of Isolated Analog programming cards:
1. 0-5V/0-10V option (PN: IS510): Using 0-5V or 0-10V signals for programming and readback.
2. 4-20mA option (PN: IS420): Using current signals for programming and readback.

8.2 SPECIFICATIONS

8.3 ISOLATED PROGRAMMING & MONITORING CONNECTOR

Refer to Table 8-1 for detailed description of the rear panel Isolated Programming & Monitoring connector. To provide the lowest noise performance, it is recommended to use shielded-twisted pair wiring.

Refer to Fig.8-1 for description of the connector.

Isolated programming plug P/N: MC1.5/8-ST-3.81, Phoenix.

**CAUTION**

When the Isolated Analog Option is installed, do not apply any signals to the non-isolated VPGM and IPGM (J1-9 and J1-10) pins. All other J1 features may be used normally.

Refer to Section 4.5 for a description of J1 features.

Parallel Operation: Optional Isolated Analog IS510/IS420 must be installed in both the Master and Slave unit.

**VORSICHT**

Wenn die optionale Ansteuerung mit isolierten Analogsignalen verwendet wird, legen Sie keinerlei Signale an die nicht isolierten Pins VPGM oder IPGM (J1-9 und J1-10) der Standardschnittstelle J1. Alle übrigen J1-Funktionen können normal verwendet werden. Siehe Abschnitt 4.5 für eine Beschreibung der J1-Funktionen.

8.4 SETUP AND OPERATING INSTRUCTIONS

8.4.1 Setting up the power supply for 0-5/0-10V Isolated Programming and Monitoring
Perform the following procedure to configure the power supply:
1. Turn the power supply AC power switch to Off.
2. Connect a short between J1-8 and J1-12 (refer to Table 4-4).
3. Set Setup switch SW1-1 to its UP position for Output Voltage external programming
   and SW1-2 to its UP position for Output Current limit external programming.
4. Set SW1 position 3 to select the programming voltage range: Down=0-5V, Up=0-10V.
5. Set SW1 position 4 to select the monitoring range: Down=0-5V, Up=0-10V.
6. Ensure that SW1 positions 7 and 8 are in the their down position.
7. Connect the programming sources to the mating plug of the Isolated Programming
   connector. Observe for correct polarity of the voltage source.
8. Set the programming sources to the desired levels and turn the power supply ON.

8.4.2 Setting up the power supply for 4-20mA Isolated Programming and Monitoring
Perform the following procedure to configure the power supply:
1. Turn the power supply AC power switch to Off.
2. Connect a short between J1-8 and J1-12 (refer to Table 4-4).
3. Set setup switch SW1-1 to its UP position for Output Voltage external programming
   and SW1-2 to its UP position for Output Current limit external programming.
4. Set SW1 position 3 to it's Up position.
5. Set SW1 position 4 to it's Up position.
6. Ensure that SW1 positions 7 and 8 are in their Down position.
7. Connect the programming source to the mating plug of the Isolated Programming
   connector. Observe for correct polarity of the voltage source.
8. Set the programming sources to the desired levels and turn the power supply ON.

CAUTION
To prevent damage to the unit, do not program the output voltage and current to higher then the power supply rating.

VORSICHT
Um das Gerät vor Schäden zu schützen, programmieren Sie keine Spannungs- oder Stromwerte, die über den maximalen Nennwerten liegen.

NOTE
J1-8 and J1-12 must be shorted together with a jumper.

HINWEIS
J1-8 und J1-12 müssen über einen Jumper miteinander verbunden werden.

NOTE
SW1 position 3 and 4 must be in their Up position for operation with 4-20mA Isolated Programming and Monitoring.

HINWEIS
Für die isolierte Programmierung und Überwachung mittels 4-20mA-Signalen müssen die Schalter 3 und 4 von SW1 in der oberen Position stehen.
8.5 PARALLEL OPERATION WITH ISOLATED ANALOG OPTION

Power supplies, should be connected in a daisy-chain configuration

8.5.1 Setting Up The Master Unit

Setting up the power supply for 0-5/0-10V Isolated Programming and Monitoring.

Perform the following procedure to configure the power supply:
1. Turn the power supply AC power switch to Off.
2. Connect a short between J1-8 and J1-12 (refer to Table 4-4).
3. Set Setup switch SW1-1 to its UP position for Output Voltage external programming and SW1-2 to its UP position for Output Current limit external programming.
4. Set SW1 position 3 to select the programming voltage range: Down=0-5V, Up=0-10V.
5. Set SW1 position 4 to select the monitoring range: Down=0-5V, Up=0-10V.
6. Ensure that SW1 positions 7 and 8 are in the their down position.
7. Connect the programming sources to the mating plug of the Isolated Programming connector. Observe for correct polarity of the voltage source.

8.5.2 Setting Up The Slave Unit

Setting up the power supply for 0-5/0-10V Isolated Programming and Monitoring.

Perform the following procedure to configure the power supply:
1. Turn the power supply AC power switch to Off.
2. Connect a short between J1-8 and J1-12 (refer to Table 4-4).
3. Set Setup switch SW1-1 to its DOWN position for Output Voltage programming by front panel and SW1-2 to its UP position for Output Current limit external programming.
4. Set SW1 position 3 to select the programming voltage range: Down=0-5V, Up=0-10V.
5. Set SW1 position 4 to select the monitoring range: Down=0-5V, Up=0-10V.
6. Ensure that SW1 positions 7 and 8 are in the their down position.
7. Connect pin 7 (IMON_ISO) of Isolated Analog connector in Master Unit To pin 3 (IPROG_ISO) of Isolated Analog connector in Slave unit.
8. Connect pin 4 (GND) of Isolated Analog connector in Master Unit To pin 4 (GND) of Isolated Analog connector in Slave unit.

Daisy-Chain Connection:
9. Connect J1-2,3 of the Master unit to J1-2,3 of the Slave unit.
11. Connect J1-16 of the Master unit to J1-15 of the Slave unit.
12. Set the programming sources to the desired levels and turn the Master and Slave units ON.

---

**CAUTION**
To prevent damage to the unit, do not program the output voltage and current to higher then the power supply rating

**VORSICHT**
Um das Gerät vor Schäden zu schützen, programmieren Sie keine Spannungs- oder Stromwerte, die über den maximalen Nennwerten liegen.
CHAPTER 9  MAINTENANCE

9.1 INTRODUCTION
This chapter provides information about maintenance, calibration and troubleshooting.

9.2 UNITS UNDER WARRANTY
Units requiring repair during the warranty period should be returned to a Lambda authorized service facility. Refer to the addresses listing on the back cover of this manual. Unauthorized repairs performed by other than the authorized service facilities may void the warranty.

9.3 PERIODIC MAINTENANCE
No routine maintenance of the power supply is required except for periodic cleaning. To clean, disconnect the unit from the AC supply and allow 30 sec. for discharging internal voltage. The front panel and the metal surfaces should be cleaned using mild solution of detergent and water. The solution should be applied onto a soft cloth, and not directly to the surface of the unit. Do not use aromatic hydrocarbons or chlorinated solvents for cleaning. Use low pressure compressed air to blow dust from the unit.

9.4 ADJUSTMENTS AND CALIBRATION
No internal adjustment or calibration is required. There is NO REASON to open the power supply cover.

9.5 PARTS REPLACEMENT AND REPAIRS
As repairs are made only by the manufacturer or by authorized service facilities, no parts replacement information is provided in the manual. In case of failure, unusual or erratic operation of the unit, contact a Lambda sales or service facility nearest you. Please refer to the Lambda sales offices addresses listing on the back cover of this user manual.

9.6 TROUBLESHOOTING
If the power supply appears to operating improperly, use the troubleshooting guide to determine whether the power supply, load or external control circuit are the cause. Configure the power supply for basic front panel operation and perform the tests of section 3.8 to determine if the problem is with the supply. Table 9-1 provides the basic checks that can be performed to diagnose problems, and references to sections of this manual for further information.

Table 9-1: Troubleshooting guide

### 9.7 Fuse Rating

There are no user replaceable fuses in the power supply. Internal fuses are sized for fault protection and if a fuse was opened it would indicate that service is required. Fuse replacement should be made by qualified technical personnel. Refer to Table 9-2 for a listing of the fuses.

<table>
<thead>
<tr>
<th>Fuse designation</th>

Kapitel 9  Wartung & Service

9.1 Einleitung
Dieses Kapitel liefert Informationen über Wartung und Fehlersuche.

9.2 Reparaturen während der Garantie
Sollte ein Gerät innerhalb der Garantiezeit ausfallen, so dürfen Reparaturen nur durch Lambda oder autorisierte Servicestellen durchgeführt werden. Die Adressen finden Sie am Ende dieses Handbuches. Eingriffe in die Geräte durch nicht autorisierte Stellen führen zum Verlust des Garantieanspruches.

9.3 Periodische Wartung

9.4 Justage und Kalibrierung
Interne Justage oder Kalibrierung ist nicht nötig. Es gibt keinen Grund, die Stromversorgung zu öffnen.

9.5 Bauteilewechsel und Reparaturen
Da Reparaturen nur durch den Hersteller oder autorisierte Servicestellen durchgeführt werden dürfen, enthält das Handbuch keine Schaltpläne. Im Falle eines defektes oder ungewöhnlichem Verhalten des Gerätes, setzen Sie sich bitte mit der nächstgelegenen Lambda Niederlassung in Verbindung. Die Adressen finden Sie am Ende dieses Handbuches.

9.6 Fehlersuche
Sollte die Stromversorgung nicht wie erwartet funktionieren, kann Ihnen die nachfolgende Tabelle helfen, herauszufinden ob die Stromversorgung, die Last oder eine externe Steuerung die Ursache dafür ist.

Stellen Sie das Netzgerät so ein, dass es mit den Reglern und Tasten am Frontpanel bedient werden kann. Führen Sie dann die Tests aus Abschnitt 3.8 durch um festzustellen, ob das Problem durch das Netzgerät verursacht wird.

Tabelle 9-1 führt Sie Schritt für Schritt durch die Prüfungen, die durchgeführt werden sollten, um die Fehlerursache zu ermitteln und gibt ihnen Hinweise auf Abschnitte dieses Handbuches in denen Sie weiterführende Informationen finden können.

</tr>
<tr>
<td>Schlechte Lastregelung. CV-LED am Frontpanel leuchtet.</td>
<td>Sind die Sense-Leitungen ordnungsgemäß angeschlossen?</td>
<td>Sense-Leitungen laut Anweisungen im Handbuch anschließen.</td>
<td>3.9.8</td>
</tr>
<tr>
<td>Bedienelemente am Frontpanel sind ausser Funktion.</td>
<td>Wird das Gerät im Local-Lockout Modus betrieben?</td>
<td>Gerät ausschalten und warten bis die Anzeigen erloschen sind. Gerät wieder einschalten und REM/Loc Taste am Frontpanel betätigen.</td>
<td>7.2.5</td>
</tr>
</tbody>
</table>
9.7 Sicherungswerte
Im Gerät befinden sich keine Sicherungen die durch den Anwender ersetzt werden können. Sicherungen sind als Schutz eingebaut, falls im Gerät Fehler auftreten sollten. Sollte eine Sicherung auslösen, so muss das Gerät zur Reparatur gegeben werden. Sicherungen dürfen ausschließlich von dafür geschultem, technischen Personal ausgewechselt werden. In Tabelle 9-2 sind die Sicherungswerte aufgelistet.
